When was the last time you saw recent military surplus available in the US??

We have a Surplu dealer locally who is part of a group of five who put
together a surprising number of winning bids for surplus electronics.
He doesn't even open up his yard locally anymore. The last I heard he
was doing very well selling it in places like South America.
Kind of makes you wonder how much American Electronics Iraq has.

Sure would love to get my hands on a couple of AN/GRC-106's cheap.

Not only are they 3-phase synchros, they also require 400-Hz supply (I think they are 28-volt, 400-Hz units). 400 Hz has been standard in aircraft for a long time because all the alternators, inverters, transformers and inductors can be made much smaller and lighter at these frequencies than with, say, 60-Hz. Since the full-wave rectified PDC is at 800 Hz, power supply filter capacitors and chokes can be physically and electrically smaller.

for the handheld cellular phone. It seems to me that you can have

good transmission and receiving
anywhere inside a building or in your car. Unlike the HT for hams,
once you get into a building or in a car, both transmitting and
receiving become bad. Can anybody out there tell me what is
going on? I also like to improve the efficiency of my HT, trans,
rece. Althought it has 7W output, it really doesn't work like that.

Thank a lot

The article is a bit too long to copy, and editing would be
too difficult - just assume my readers have seen the original.

I'm not quite sure what the problem is. I've made many contacts
both in and out of the country, and found that some hams are only
interested in working contest-style, presumably collecting QSL
cards or 10-10 numbers or whatever, never saying more than 59
pse QSL 73, and others can get into meaningful discussions on
nearly every topic.

We have the "no business" restriction; it is really proper, for
without it the ham bands would be business bands.

We have the restriction against obscenity, honored more in the
breech by a tiny minorty, but one that is salient.

We have the music restriction, which somehow I think applies to ALL non-broadcast services.

Other than that we can and do talk about nearly everything.
'
Using the malcontents of 20 meters as examples (such as the noted impropriety of announcing club meetings on the air) is a rather sqlirrily comment. We do such announcing and will continue and will make no secret of it.

I read the posting twice and still don't quite understand the problem. Sure, most DX'ers, especially I's, U's and OK's, have very short canned qsos, but not all. And sometimes it's hard to get a G or DL to quit (but more often they're fascinating.) But I've had many lengthy talks with hams in nearly every country - the big thing is to convince them that their English isn't making them sound stupid. {The converse is the average G. They ALL need a couple years residence in Texas to learn to speak English properly; big problem is they don't know it.}

So maybe I'm missing somethimg, but ** what's the problem ** ?

Several BBSs on the east coast have been cited by the FCC for the CONTENT of a packet radio message passing thru their systems. The following is a 4-part BIDed bulletin I have sent to @USA for national distribution describing the situation. Please feel free to circulate this info on your local distribution channels since it is most important to get the word out.

FYI -- this is the >>LAST<< @USA messages thru W3IWI before I close that distribution channel here!

```
SB  URGENT@USA < W3IWI  $38140_W3IWI

```

FCC CENSORS/CENSURES PACKET RADIO

Tom Clark, W3IWI
January 30, 1991

Today a number of packet BBSs on the east coast received citations from the FCC's Norfolk (actually Virginia Beach) Field Office which may well spell the end to much of amateur packet radio. According to Jim, WA4ONG the following packet BBSs (and perhaps others) are involved: N3LA, WA3TSW, KA3CNT, KA3T, WA3ZNW, W3IWI, WA4ONG, WB0TAX and N4HOG [my copy of the citation has not yet arrived in the mail -- the details in this message are taken from a copy WA4ONG faxed to me].

The letter dated January 25th from Mr. J. J. Freeman, Engineer in Charge at the Norfolk Office, to WA4ONG states:

"I have received a report that indicates you may have operated your amateur radio station, call sign WA4ONG, in violation of Section 97.113(a) of the Commission's Rules. It appears that you used the Amateur Radio Service to facilitate the business activity of THE COALITION TO STOP U.SD. INTERVENTION IN THE MIDDLE EAST."

"Specifically, on or about January 5, 1991 you received a packet radio message originated by amateur radio station WA3QNS. You then transmitted this packet radio message to another amateur radio station. The message was:

{ Here appears a copy of the message sent by WA3QNS@N3LA.PA originated at 22:22z on Jan.5 with the BID #21035_N3LA, Subject: Call This Number ASAP. The message listed the business telephones and fax numbers for "The Coalition" as well as a 1-900-xxx-xxxx number to call to "register your voice" I won't repeat the bulletin here, because repeating the bulletin would make it illegal to send this message! }

(Continued in Part 2)

/EX

```
SB  URGENT@USA < W3IWI  $38141_W3IWI
FCC CITES BBSs FOR @USA MSG (Part 2/4)
R:910131/0445z 38141@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]
```

FCC CENSORS/CENSURES PACKET RADIO cont'd

"This activity was a facilitation of the business affairs of the Coalition to Stop U.S. Intervention in the Middle East and therefor {sic} in violation of Section 97.113(a)."

The FCC citation then contains the boilerplate demanding a response within 10 days explaining circumstances and correct actions, and then closing with a chilling "to determine what, if any, enforcement action is required to insure current and future rule compliance" and a statement that future transgressions will bring fines and/or license revocation.

That's the facts. I'll now discuss some of the implications and recommended actions.

THE IMPLICATIONS

The implications of the action by the FCC's Norfolk Field Office are absolutely appalling. What is implied is that each and every station in a store-and-forward network is responsible for the actual message CONTENT passing through each node. The BBSs were cited because their calls were in the message header "audit trail". The FCC's action states that each BBS SYSOP is personally responsible for the "correctness" of all messages merely passing through his system. Here, the W3IWI mail switch handles about 10,000 messages per month automatically. There is NO WAY that I can vouch for every bit that passes through!

If the FCC had instead gleaned its information from on-the-air monitoring, then all the THENET/NETROM/ROSE/TCPIP/DIGIPEATER switches handling the message would have been equally culpable! The implication of the FCC action is that a node control operator must read all information and be prepared to shut the system down at the first hint of an "inappropriate" message. It's hard enough to watch the information passing on 1200 BPS links -- imagine the impossibility of "censoring" 56 kBPS or faster channels.
(Continued in Part 3)
/EX

SB URGENT@USA < W3IWI $38142_W3IWI
FCC CITES BBSs FOR @USA MSG (Part 3/4)
R:910131/0445z 38142@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

THE IMPLICATIONS cont'd

In future networks where redundant channels exist, it is quite possible that a given message will be fragmented and parts of it sent via several parallel paths. The message may exist as a complete entity only at the ends of a virtual path. It would be impossible to implement the censorship the FCC seems to be demanding with such a network, so the "legality" will interfere with development of new technology.

Consider another recent development: amateur packet radio satellites. PACSAT is licensed by the FCC with a US trustee and a cadre of US sysops. PACSAT is, in essence, a flying BBS with the sysops on the ground. In order to screen out "offensive" messages, a ground-based SYSOP has to use a radio channel to verify message CONTENT. But the FCC letter says that the very act of reading an "offensive" message on the radio is illegal. If the Norfolk FCC action is allowed to stand, the logical implication is that PACSATs must be turned off!

A number of us have discussed such issues with responsible individuals at the FCC in Washington ever since the first fledgling days of packet radio. The signal that the FCC sent was that the sole responsibility for the CONTENT of a message lays with the ORIGINATOR. The actions of the Norfolk Office seem to indicate a new policy has been adopted which effectively kills packet radio.

Or -- perhaps -- the Norfolk Engineer in Charge who issued the citations was offended by the particular message and chose to take out his frustrations on all the "King's Messengers" who brought the message to him?

W3IWI COMMENTS AND RECOMMENDATIONS

It is ironic that the WA3QNS message that brought down the wrath of the FCC a number of the BBSs that "touched" his message brought a very vocal response from the packet community informing him that

(1) 1-900-xxx-xxxx are in fact commercial ventures designed to raise money and that a call to the number would cost the caller.

(2) The subject message was probably in violation of 97.113(a) and probably illegal

(Continued in Part 4)
/EX

SB URGENT@USA < W3IWI $38143_W3IWI
FCC CITES BBSs FOR @USA MSG (Part 4/4)
R:910131/0445z 38143@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

W3IWI COMMENTS AND RECOMMENDATIONS cont'd

Personally, I have been silent (but very frustrated) that about the 10% of bulletins addressed @USA (or @ALLUS, @ALLBBS, etc.) that are in poor taste. I have grown tired if blather about censorship, First Amendment Rights and the incredible volumes of hate mail. WA3QNS, by his statements and by the responses to his statements from other folks, has been one of the causes of this frustration. I have longed for the return to normalcy with messages on technical topics and personal communications. I have found it frustrating to pay the electric power bill and pay for the W3IWI hardware for others to engage in marginally offensive "Free Speech". I have wished that the (ab)users of @USA would have exercised more discretion with self-censorship.

But I have gritted what teeth I have left and avoided being a censor. Now, the FCC's CENSURE has left me with no alternative than to be a CENSOR.

Until the FCC tells me that I can do otherwise, I will only release @USA messages that I personally screen and am willing to stake my license on. The priority on my time is such that I don't expect to have time to screen @USA bulletins. Any complaints about my decision will be sent to /dev/null.

{ For other SYSOPs: my way to do this is to have my SWAP file change all @USA etcetera to a dummy address like @HOLD -- thereby preserving any BIDs so I don't get deluged with multiple copies of the same message. Until we get a clarification I would recommend that you also use a similar message condom and practice "Safe BBS". }

For the vast majority of you who do not abuse the system, I'm sorry that this situation has come up and that your ability to "fan out" information will be hindered. Since there have been very few instances of "offensive" personal messages, I'll take the risk of keeping all other packet mail flowing here and I hope the other BBS SYSOPs do likewise. But PLEASE exercise self-policing. The BBS SYSOPs don't want to be held responsible for YOUR words.

The ARRL has already been informed about the Norfolk citations. Because of the potentially devastating impact on all packet radio if the Norfolk situation is allowed to stand, I anticipate a lot of phone calls to be made in the next few days!

A half wave whip antenna (such as made by AEA and others) does a wondeful
job at increasing range.  Going from duck to whip causes a jump in range
much greater than going from low (1w) to high (7w) on the IC-2GAT.

Don't confuse this with 5/8 wave whips which will have a distorted pattern
without a ground plane.

Yes, you MAY do this. But that is not the ONLY way to do it. If you trust
the operator well enough, you may allow that operator to be the CONTROL OP
of YOUR station, even in your absence.

Can you tell me where have you bought your 144MHz to 10 GHz
transverter. This sounds interesting that one can converter the HF
radio to a all band all mode receiver. Currently, I am using a
TS440AT. Thank a lot

JC, N6YEI

The Synton Amateur Radio Club (of the University of Illinois at Champaign-Urbana) holds a club station license with callsign W9YH.

The club COULD loan its equipment to its members or other amateurs for them to operate as part of their own station. The club policy is that this is not usually done. We do allow users of the club packet station to switch to their own call because that is necessary to pick up mail from a packet BBS. We also have a loaner HT but I don't recall a policy on what callsign to use with it. The policy on borrowing it is somewhat strict.

Primarily the club station is to be operated under the station license of W9YH. Since the station trustee (whose name is on the club station license) holds an Extra class operators license, we don't have any problem with allowing anyone to use the station when they have to use their call. Of course the control operators have to operate within the privileges their operators license permits.

This is considered not only a legal way to operate, but some of the membership even suggested that any other way was not legal (which I disputed but that is another issue). The club chooses to simply NOT loan its equipment to amateurs for operating purposes, with a small set of exceptions in special cases.

RTTY DX Notes 1of3 1/25/91

RTTY DX Notes for week ending 25th January 1991
BID: $RTDX0125A
Part 1 of 3.

As this is my first bulletin, please let me thank Tom, OD5NG, who has assisted me from his bunker on scouting news and notes, in spite of the Scuds in the Middle East. My apologies to those who will not find the following as (DX1) standard level. The week seems to have gone very fast with the gulf situation, and the successfull Afghanistan dxpedition went in second order, nevertheless the risk of the participants. For the next two weeks, till (DX1) will be back from vacation, address all DX news to:

OD5NG @ VK2AGE.AUS.OC or
OD5NG @ TG9VT.GTM.NA or
OD5NG @ SK6CS.SWE.EU

Hope for more news and bandpass next week.

Our thanks this week go to I5ICY, I5IGQ, JA1ACB, TG9VT, OD5NG, VE3OCX, YU4XA, DL8AAM, W2JGR and the Tri-State DX Packetcluster Network. Thank you all for your information.

SB RTTYDX @ ALLBBS $RTDX0125C
RTTY DX Notes 3of3 1/25/91

RTTY DX Notes for week ending 25th January 1991
BID: $RTDX0125C
Part 3 of 3.

QSL Information:

BY4AA, Dieter from Shanghai, asks card via DJ7BU.

HH2PK QSL is via the QSL mgr N1DRS.

YA0RR QSL is via UT5RP, Dmitry S. Slyusarenko, Box 300 Odessa 270000, Ukraine USSR, only for RTTY QSOS. Do not send CW or SSB cards to Dima.

9X5LJ QSL route is via Belgian Embassy, BP 01, Kigali, Rwanda.

New QSL address for 3DA0DX is Sam Ford, ZS6BRZ, Box 691, Gallo Manor, Sandon 2052, R.S.A.

PY0FF wants cards via W9VQ.

UG1700GWG QSL goes via home call UG7GWG.

Notes of Interest:

YA0RR, Romeo and Valery, have been very active in their last three days of operation, January 18th, 19th and 20th. They left Kabul on the 21st.

7Q7LA has received RTTY gear and is now ready to start.

Also TN1AT, another exotic one from Africa is QRV, but the gear is for commercial use and his activity will be sporadic.

UG1700 is a new special prefix to celebrate the 1700 years of Christianity in Armenia. That country was the first in the world

```
which had Christianity as a state religion in 301 AD.  From 1991 up to
2001 they will use this special prefix for one month each year in
January.

GL DE DX2 (I5FLN) AT OD5NG.

This bulletin was edited for packet from notes written by I5FLN, and
relayed by Tad, KT7H @ N7ENT.#WWA.WA.USA.NA.

I spent a *great* deal of time trying to copy some RTTY 1/29/91 in the 8 and 9 Mhz band. I was using a PK232 et al...

I had a tuning scope to help get on center.

The Problem...I got garbage almost everyway...allot of the stuff looked like 850 shift, the mode of which I still do not know.

I did find the wideband filter to have an obnoxious step in its response, so it may have been (the signal) been acutally wider or faster(???) that the 232 can *really* handle.

In the SIGNAL mode the unit quite often reported 75 BAUD, unknown.

It sounded more like 5 level code then ASCII. although I tried both modes..also played w/ inverted tones..

The system works fine, as I checked it out in the ham bands (20MHz).

Anyone have an idea of the make-up of the stuff in this area, or other interesting area ?

Thanks N1BAQ

Lines: 91

-- MAJOR SOLAR FLARE ALERT --

JANUARY 31, 1991

** MAJOR IMPACT EXPECTED **

Flare Event Summary

MAJOR ENERGETIC EVENT SUMMARY

Two significant X-class flares exploded off of the sun over the past 24 hours. The first flare (and least-significant) occurred at 09:04 UT on 30 January. The flare was rated a class X1.0/2B flare and was not associated with any sweep frequency events or other significant radio bursts. It was produced by Region 6466. The flare location was S08W34. The duration of the event was 1 hour and 27 minutes. No significant impacts are expected from this flare.

HOWEVER, another major X-class energetic flare erupted early in this UT day. The flare peaked at 02:30 UT on 31 January and has been classed an X1.3/2N Tenflare. This flare was associated with significant Type II and Type IV sweeps (rated at an intensity level of 2)! The duration of this flare was 103 minutes (or 1 hour and 43 minutes). It was associated with a 600 s.f.u. Tenflare. The flare originated from Region 6469 at a location of S11W27. This region has grown explosively over the past 24 hours.

A PROTON WARNING HAS BEEN ISSUED BY THE SPACE ENVIRONMENT SERVICES CENTER! Protons are now arriving (as of 06:30 UT on 31 January). Models are predicting a proton event with flux levels as high as 200 p.f.u. at greater than 10 MeV! This is expected to be a SIGNIFICANT proton flare!

A POLAR CAP ABSORPTION WARNING has been issued for high latitude regions. The expected influx of energetic protons could produce a moderate intensity PCA over polar and high latitude regions. An associated radio blackout could occur over the polar and high latitude regions if the PCA becomes intense enough.

A MAJOR GEOMAGNETIC STORM is expected to occur on 01 February in response to this latest proton flare. An SSC is expected between 08:00 UT on 01 February and 20:00 UT on 01 February, followed by the main phase of the storm several hours later. This storm could last between 18 and 36 hours. The probability for a major geomagnetic storm is very high (80%). Global geomagnetic storm intensities are expected to push the magnetic

A-index to levels between 50 and 100; localized activity could easily surpass this rating.

A MAJOR AURORAL STORM is expected to occur when the geomagnetic storm begins. An auroral storm alert has been issued for all middle AND LOW LATITUDES! If activity reaches levels currently anticipated, widespread auroral activity will become visible over middle and low latitudes (as well as high latitudes).

MAJOR HF RADIO PROPAGATION DEGRADATION is expected to occur with the onset of the main phase of the geomagnetic and auroral storming. Radio blackout warnings have been posted for high latitudes and middle latitudes. All latitudes will experience major disruptions in HF propagation conditions.

BISTATIC AURORAL BACKSCATTER COMMUNICATIONS ALERTS are being issued to high and middle latitudes, with increased possibilities for successful (albeit quite disturbed signal qualities) auroral communications over low latitudes.

A POTENTIAL ELECTRICAL ANOMALY WARNING is being issued to all organizations and industries which could be affected by significant geomagnetic perturbations. A risk for geomagnetically induced electrical currents into long conductive objects exists during the main phase of the expected geomagnetic storm, provided the intensity of the predicted storm reaches or surpasses levels anticipated. Potentially affected industries include: Electrical power distribution networks, continental or transatlantic telecommunications networks, pipeline networks, railway systems, etc. Strong magnetic perturbations may develope with intensities capable of inducing currents into relatively long, ground-based conductive objects. All organizations and industries which could be affected are warned to be on the alert for potential anomalies. Anomalies could occur anytime after the main phase begins (which is expected between 08:00 UT on 01 February and about 04:00 UT on 02 February).

Further major flaring from the potent regions currently on the solar disk is likely over the next 3 to 7 days. K-indices could reach levels between 7 and 9 during the main phase of the geomagnetic storm (note that a K-index of 9 is the top of the scale for measuring magnetic perturbations).

For revised prediction charts, consult the Potential Major Geomagnetic Storm Warning which has been posted in conjunction with this alert.

** End of Report **

Hello again, Netlanders, Shortwave enthusiasts, and Interested parties

ANOTHER PUBLIC SERVICE ANNOUNCEMENT FROM THE WORLD SERVICE OF THE CHRISTIAN SCIENCE MONITOR:

"It was announced today, January 30, 1991, that The World Service of The Christian Science Monitor, in response to many requests concerning the offer of Shortwave radios at cost to servicemen and servicewomen overseas, will now accept ORDERS or DONATIONS from firms or individuals for the purchase of SW receivers, to be sent to Armed Forces Morale Officers overseas. The Morale Officers will distribute these radios to day rooms and orderly rooms of the many units currently stationed overseas, especially in the Middle East.

"For those of you who wish to make a contribution towards a radio for our Armed Forces, you may do this directly by mailing your contribution to:

The Christian Science Publishing Society
c/o General Marketing P410
One Norway Street
Boston, MA 02115

or you may call toll-free 1-(800)-448-2466."

As indicated in an earlier Announcement, Sangean ATS 803-A and MS103-A radios are being offered at cost ($123.00 and $65.00, respectively) to be shipped to any APO or FPO address, with no additional shipping or handling fees. This offer will expire on May 1, 1991.

Please feel free to e-mail me or post any comments, and I will try to respond promptly.

To which I say why? I like my call of WA6SDM, and I do not like the
AA6xx or I guess by now AB6xx calls.  If you are confused by hearing
my call in the Extra class bands too bad.  I've had that call for a
number of years and I expect to keep it for a number more.
Jim (causing confusion), WA6SDM

   I seem to recall that there have been deaths due to mis-handling
Beryllium oxide ceramic insulation. This is independant of HT voltage,
many modern RF power transistors also pose this threat. Equipment
containing BeO ( not Danish record players :-) ) constitutes a threat
even when unpowered.

** End of Quote **
The license is a STATION license, not yours! You have an OPERATORS license!
Therefore a CONTROL operator you designate (of appropiate class) may operate
your STATION using the STATION's callsign at any time you allow them...and you
can be at another STATION using that callsign! (In fact you could actually and
legally swap STATIONS (IE you go to his house and he comes to yours) and work
each other ....using the STATION's callsign...not the one you normally use.)
This even has a chance of a callsign being heardalking to itself! IE; A
control station mobile on 220.5 or above (that USED to have sign /AUX but
doesnt have to anymore) talking to the home station its remotely controlling.
I do this all the time on 220 using my ACC Shackmater at home (WB5ITT remote
base or legally its WB5ITT) and me mobile controlling the simpatch or HF rig
from the control rig in my car (WAS WB5ITT/AUX...Now just WB5ITT)
Neat huh?
73

Behind the Keebler factory here in New Jersey, is a large, round stand of trees, in an otherwise empty field. It is here that the Keebler Elves ply their trade.

Please Note:

The following report has been delayed in order to analyze the data being collected so far regarding the enormous burst of solar activity which has occurred recently. This report has been updated to be valid as of 30 January.

Also, a small addition has been made to the reports. The HF propagation prediction charts, geomagnetic prediction chart, solar activity prediction chart, and the auroral activity prediction charts now have a confidence rating associated with them. All uncertainties and possible inaccuracies in the predictions are calculated to determine the approximate confidence of the given charts. This confidence level is stated as a percentage. Low percentages represent low confidence levels and therefore high uncertainties and possible inaccuracies in the prediction charts. High percentages represent high confidence levels and low amounts of uncertainty and possible inaccuracies in the prediction charts. So the higher the confidence level, the more accurate the predictions should be. As can be seen, the confidence levels for many of the charts in this report are quite low. This is in response to the uncertainty of the intensity and occurrences of major flaring.

/\

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

January 30 to February 05, 1991

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 22 JANUARY TO 29 JANUARY.

A major burst of solar activity has occurred over the past week. The solar flux soared from a level of 221 on 22 January to 367 on 30 January! This increase matches the solar flux achieved on 10 November, 1979 (the current flux level is the highest so far recorded for this solar cycle).

Solar activity was moderate to high this week. A very powerful class X10.8/SF long-duration Tenflare erupted from Region 6471 as it came into view on the eastern limb. This flare was associated with strong Type II and IV sweeps, and strong discrete radio bursts. The peak burst at 245 MHz was 57,000 s.f.u. (solar flux units), while the 10 cm wavelengths experienced a peak burst of 3,500 s.f.u.. The flare was a long-duration event, lasting 3 hours and 28 minutes. The location of the flare was S16E78, near the eastern limb.

On 27 January, yet another powerful X-class flare erupted from Region

6471. This flare was rated a class X1.9/1B Tenflare which was associated with strong discrete radio bursts and a Type IV sweep. The flare occurred at a location of S14E59 and reached a peak intensity at 15:50 UT on 27 January. The duration of this flare was 1 hour and 25 minutes. A weak proton enhancement was observed after 04:00 UT on 28 January. A polar cap disturbance has also been detected. The disturbance commenced near 18:00 UT on 28 January, in response to the proton enhancement.

Regions which have been active are Regions 6462, 6466, 6469, 6471 and 6476 (a significant increase over the past months). Region 6471 is presently the most formidable region visible. It has a strong magnetic Delta configuration and an extensive penumbral region. There are 55 spots visible in this region alone. Magnetic gradients and fields are high across the inversion line in the trailer spot complex. Further major flaring from this region is very likely. Region 6471 is also the largest region on the disk, covering an area of near 6,690 million square kilometers, an increase of 1,920 million square kilometers in only the past 24 hours (a remarkably rapid increase in area). The size of this region, combined with the complexity of the system and the associated magnetic gradients make this region a prime candidate for potential energetic proton flaring. Regions 6462 and 6466 (which did contain high gradients and Delta configurations) have decayed and relaxed somewhat. But they are still capable of producing major energetic flares.

Region 6476 has shown some very bright plage recently, which is being held partly responsible for the increased solar flux. The background x-ray flux as of 30 January was at a level of C2.8 (due also in part to the rapid growth of several regions, including Region 6471). Enhanced x-ray background levels are anticipated for the next week.

Radio propagation conditions have been very good recently, excluding the occassional shortwave fades which have occurred due to the minor and major flaring over the sunlit hemisphere. The enhanced ionizing solar radiation has provided openings all the way up to 6 meters. The relatively low levels of geomagnetic and auroral activity have provided very good opportunities for DX on the HF bands.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain moderate to high throughout the remainder of the week. The potential for proton flaring is high. M-class flare probabilities are at 95%. X-class flare potentials are steady near 40%. There is also a significantly high 45% probability for proton flaring over the next three days at least. The Space Environment Services Center is continuing a condition YELLOW alert status for potential PCA activity. This means that a high probability exists that a polar cap absorption event could occur on the heels of an energetic proton flare. Hence, polar regions are advised to remain on the alert for potential PCA related activity (ie. radio blackouts, neutron or riometer activity, etc). Region 6471 will be crossing the central meridian by 01 February. It is now in a more sensitive position where plasma ejection trajectories could have major impacts with the earth. The risk for proton and PCA activity will peak as it edges into the western hemisphere.

The solar flux is expected to remain high for the next two days, afterwhich it should begin declining. The sunspot number hit 418 on 28 January, and is now holding at a value of 378 on 30 January. Models are currently examining the situation to determine the potential significance of this recent burst of activity for the longer-term. Conclusions will be posted in a few weeks.

Geomagnetic activity could easily reach minor to major storm levels over the coming week. It is heavily dependent on how energetic solar activity becomes. Hence, the accuracy of any prediction is likely to be low due to the unpredictability of the time, duration and intensity of any occurring energetic events. Enhanced activity is likely between about 03 to 06 February due to possible enhanced corpuscular emissions from Region 6471. There is also a chance for slightly enhanced activity near 02 February due to recurrent coronal activity. But by far, the greatest risk for significant geophysical activity exists in the potential for strong major flaring in the active regions currently visible (particularly Region 6471).

Auroral activity should remain at low intensity levels until about 03 or 04 February, when increased activity could become visible. Again, this is heavily dependent on the frequency and intensity of solar flaring. Moderate activity should be visible over high latitudes, while low latitudes should witness mostly low activity. Please note, however, that a significant risk exists for major auroral storming if strong solar flaring occurs within the next five to seven days, particularly from Region 6471.

HF propagation conditions should remain well above normal until near 03/04 February (or possibly even later), barring any significant major solar flaring. There is a high risk for fairly frequent short-wave fades and SID's due to the numerous minor M-class flares and subflares which are occurring over much of the solar disk. These effects will remain confined, of course, to the sunlit hemisphere.

VHF propagation conditions will be normal to above normal this week, with higher potentials for DX, particularly on the lower VHF bands. If strong major flaring occurs, watch for possibly wide-spread bistatic auroral backscatter communications on the VHF bands during periods of possibly strong auroral and geomagnetic activity. Watch for possible predictions included in any future major flare alerts or magnetic storm warnings.

```

CONFIDENCE LEVEL: 35%

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

    ------------------------------------------------------------
               Cumulative 60 day Solar Activity Record
                   Start Date:  December 1, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

                ***  POTENTIAL GEOMAGNETIC STORM WARNING  ***
                *********************************************
```

Issued: 07:30 UT, 31 January

Geomagnetic Storm Warning
Revised Forecasts

ATTENTION:

A MAJOR GEOMAGNETIC STORM associated with a SSC is expected to arrive at the earth between approximately 08:00 UT on 01 February and 20:00 UT on 01 February. Models indicate there is an 80% probability of a major geomagnetic storm attaining planetary magnetic A-index values of near 80 and associated K-index values as high as 7 or perhaps 8 over middle and low latitudes. High latitudes could experience STRONG MAJOR STORMING to SEVERE MAGNETIC STORMING. There is also a high risk that middle latitudes could also experience periods of SEVERE magnetic storming. The storm is expected to last anywhere from approximately 24 to 36 hours with active residual post-storm perturbations. The major energetic X-class flare of 31 January with associated strong Type II and IV sweeps is being held responsible for the predicted geomagnetic storm.

A MAJOR AURORAL STORM WARNING has been issued for all high and middle latitude locations. The storm is expected to reach very intense levels over high latitudes, stretching down even to the middle latitude regions. The auroral zone is expected to migrate notably southward, possibly beyond regions along 47 north latitude.

A LOW LATITUDE AURORAL ACTIVITY WARNING has been issued. Auroral activity is expected to reach intensities capable of being viewed from low latitude regions. The main phase of the storm may not begin until near sunrise in North America on Friday morning. North American observers will probably have to wait until after evening twilight to attempt to spot any auroral activity. Observers in Europe and the UK will probably witness the onset of the main auroral storm.

A POTENTIAL ELECTRICAL ANOMALY WARNING has been issued for high and middle latitude regions. This warning is intended to alert those organizations and/or industries which could be affected by geomagnetically induced electrical currents to the increased potential for experiencing anomalies anytime after the main phase of the geomagnetic storm begins. Currently, the main phase is expected between approximately 08:00 UT on 01 February and 04:00 UT on 02 February. This warning is not intended to represent an absolute guarantee that anomalies will occur. Rather, it is intended to serve only as an alert mechanism to make those organizations or industries aware of the increased risk for magnetically induced anomalies on long conductive ground-based objects.

MAJOR RADIO PROPAGATION DISRUPTIONS are expected for 01 February and 02 February. Some improvements are expected late on 02 February and into 03 February. However, residual magnetic activity and enhanced corpuscular emissions are expected to keep propagation qualities below normal until about 04 February. There is also a significant risk for further major proton flaring, which could prolong the period of degraded radio conditions as well as prolong and/or intensify the geomagnetic storming and terrestrial activity.

A POLAR CAP ABSORPTION WARNING has been issued for the polar and high latitude regions. This latest flare is a suspected proton flare which is expected to attain flux levels near 200 p.f.u.. If these levels are attained, a PCA will almost certainly occur (and may already be in progress at the present time). Radio blackout conditions may exist over the polar and high latitude regions if a PCA should develope.

REVISED PREDICTION CHARTS FOLLOW - THESE CHARTS SUPERSEDE THE CHARTS GIVEN IN THE SOLAR TERRESTRIAL FORECAST AND REVIEW.

The impedances you quote are not the impedances of your ceramic and crystal filters in all probability, as the filter manufacturers do not usually quote this - they specify the impedance that should be presented to both ports of the filter. Some filters do look like the conjugate of this, but others can be very different. Ceramic filters also misbehave when presented with wrong impedances.

Without specific circuits or even the operating frequency, only general guidance can be given :

Lossy network - Just a minimum loss pad and a loading capacitor, works for any frequency, easy to calculate but useless due to insertion loss for any actual application. (i use these when measuring filters on a network analyser when accurate termination is more important than loss)

Modify the circuit to give needed source and load impedances - this may be possible if the filter drives a fet gate directly and if the circuit driving the filter is aperiodic, otherwise you must analyse the existing tuned circuits and synthesise a new network for each port of your filter.

Use a matching transformer, possibly with a loading capacitor -
RF transformer design is a black art at high and complex impedances
nuff said ?

Use matching networks of th resonant kind - you know the Z that should have been presented to your old filters, a Pi network can be synthesised to convert this to that needed by your new filters.
My favourite hunting ground for Pi synthesis are the 2 volumes of "motorola rf device data" which contain all the equations in handy easy-to-use form as well as tables of precalculated values. although these are aimed at power output stages, the values are correct.

I'd cast my vote for resonant transformation. They give extra out of band selectivity. Both quartz and ceramic filters have got spurious responses just outside their passbands (worse in monolithic filters than in
"discrete
"filters)
it is bad practice to rely on block filters for all your selectivity for this reason.

73 have fun !

That sounds like a preemptive accusation. By your implicit reasoning, one could argue that speaking on the air should be forbidden, because the things you say could come from copyrighted books.

I think the legal reasoning was that if you are putting music on the air, it will tend to make your transmission "public entertainment."

I think the rule could be eased enough to allow, say, a few notes to pass back and forth between 2 hams having a discussion of music theory without the ham bands turning into a broadcast medium.

I own the Diamond X200, which is about the same antenna, I am told, with a different name. It is a good performer, and I am pleased with it (and this from a dyed-in-the-wool Isopole fan). A friend who has the Comet 15 foot dual band antenna commented that the construction of his Comet was the same as the Diamond, but in three sections rather than the two sections of my smaller Diamond. I can recommend these antennas as they seem to have very good gain and low SWR (no other actual measurements made)....chris

I am seriously considering buying an Icom IC-751A this spring and would like
comments from anybody who has one or who also considered one but bought something else.
I intend to operate CW exclusively on 40 through 10.
I had a brief fling with the thought of buying a TenTec Paragon, but can't
justify the extra cost. Can somebody convince me otherwise? Is the 751
$400 better than, for example, the IC-735, or maybe Kenwood's TS440?

Thanks in advance,

```

>What could be simpler? Or is it that simplicity doesn't play well with
>today's Hams?

When you say "type of license held" you fall back into the rut the FCC accidently dug up in the 90-55 final decision. There is no such thing as a "Tech+HF" license class; there is JUST "Tech". The difference is in how one got there.

By making TWO DISTINCT license classes and eliminating the requirement to hold the CSCE (read my comments to 90-55 against use of CSCE) then you can do what you have above, and it would make sense.

It might be adequate enough to simply add wording to the rules (as changed by 90-55) to allow proof for HF privs of either the CSCE *OR* the Novice license *OR* the older Tech license. There are technical bureaucratic problems, but that is the FCC's worry. They got themselves into this mess.

It would also simplify things a bit if we eliminated the "two generals" method of testing for Novice and just had everything tested by VE's.

>The real problem, and the one I posted just after the new structure was

>announced, is: How you gonna tell the Techs from the "Tech+HFs" without some
>kind of call sign differentiation? Some have complained that this will
>result in on-the-air discrimination, and I'm sure that some of that will
>occur. But it's not JUST a matter of on-the-air discrimination. It's an
>administrative problem that must be dealt with, and this thread has properly
>identified it. THE FCC and ARRL ought to fix their mess.

I disagree that there is any need to distinguish class on the air. How do
you know that KA9WGN can't operate in the Extra phone band? You can't by the
callsign alone. You can look up KA9WGN in the callbook, the marvin database,
or other places, and find out I am a TECH.

Of course with there being TWO KINDS of Tech, this is difficult. But how
do you do it? You COULD give the NEW techs a different callsign, but they
can upgrade and keep it. You could require them to change, but that will
just become a DIScouragement to upgrade. You can add suffix /N to TECH+HF
but those who already have TECH before FEB 14 will be affected.

Using stupid callsign tricks is NOT the way to do it.

I don't like HRO. They don't post prices in their retail stores ... not even for cables, books, and the like. You always have to ask a salesperson for prices. I really find this to be a big inconvenience, and I suspect that they are trying to hide their prices.

Their salespeople rarely know much about their products. I realize that this is a common problem in retail stores, but I figured that since all of their employees are hams, they should know something.

Once again, the intrepid QSL manager is trying to find the owners of some cards that linger on unclaimed. How does one find hams that are not listed in the current callbook, and are also not listed in the Buffalo callsign server? I have a bunch of these "lost souls". Each has more than 1 card here,

so they are probably not just callsign errors by the sender.
Examples are WL8E and KB8EOO.
Any suggestions would be appreciated.

Bob W8ERD
"8E" ARRL QSL manager

Well, Phil, let's see.

Let's say that Saddam didn't have GPS...

Then he [or one of his agents] reads Henry Spencer's article...

Suddenly, someone buys a bunch of GPS units...

And then ships them off to Iraq...

So, Phil, now do you understand?

> receiving become bad.

There are several things that give cellular an advantage over the typical 2 meter handheld running through a repeater.

First, the wavelength is 35 cm. instead of 2 m, allowing superior penetration of apertures such as windows in buildings.

Second, cellular cell-sites are usually around 3-4 mile radius, so you're never very far away. 2 meter repeaters usually have much larger coverage radius than this. If you were only 2 miles from the 2 m repeater, it would work great inside the building.

Third, cellular typically runs transmit ERP of about 100 watts per channel for the link from cell to mobile. Mobile is somewhat less, maybe 10 watt ERP for car phones and 1 Watt ERP for handhelds. But the mobile-to-cell link uses receive antenna diversity at the cell-site further improving things.

Don't forget that the region also has good Loran-C coverage from two
permanent chains in Saudi Arabia. My own experience with the Northeast
USA Loran-C chain has been repeatable accuracy of 20-40 meters; this
is better than the 100 meter figure given for GPS with selective
availability turned on.

Furthermore, Loran-C is available 24 hours/day, unlike GPS which has
coverage gaps. According to publicly available orbital elements and
operational schedules, there is currently a daily gap in GPS coverage
in the Baghdad area from about 1130 to 1200 UTC. (A gap is defined as
fewer than 4 operational satellites visible simultaneously, including
both Block I and Block II spacecraft.)

I own a Yaseu FT-212RH. I've had it for over two years now, and have never had any problems with interference from the car's electronics. Very recently the radio has began to pick up an altenator whine over the received audio and also superimposes it on my transmitted signal. The radio is connected to ground and the positive terminal on the battery. The battery is new and I just had the altenator rebuilt, but the whine persists.

I want to know:

1) Why did the whine appear suddenly when the radio the radio has worked fine, free of whine, for the past two years?

2) What can I do to correct my problem? Is there an easy inline power filter that I can install that can handle the 20 amp draw when the radio is at high power?

3) Can I buy a manufactured filter or do I have to make one myself? IF I make it what parts do I need, if I buy it where and what brand/ model number.

Thanks for the help on this. I would appreciate email responses since I don't have the opportunity to read all the posts in this newsgroup very often.

A recent posting saying that a novice should purchase a good
transceiver to get started and then enter the home brew arena. Plowing
into ham the way I do everything else I was assuming I would build my
own receiver and transmitter. Can anybody shed some light on cost
of each approach (assuming used equipment) and maybe some reasons I
should go one way versus another? Obviously the purchase approach is
mostly plug and go, but I was hoping to use my entry into ham as a
way of increasing my knowledge of electronics in general.

Thanks

>What do you recommend for the "average" swl'er who would like to try this?

Small receiving loop antennas can display extremely sharp nulls; the nulls
are bidirectional and normal to the signal path. This 180 degree uncertainty
can be elinated via a "sense antenna" (usually a small vertical whip) and
a few bucks worth of parts. Have a look at the ARRL handbook for ideas.
The parts aren't expensive, although some care in fabrication is required
to get sharp nulls.

I have to confess, when I went on DXpedition to FG back in 1983, I was lucky enough to work back into my home area. After working me from his home station, one of the locals raced across town and worked my from MY home station, using MY call. Should I tear up the card I sent myself? :{ I can assure you that it has been accepted for Grid Square credit. I don't have enough countries yet on six meters (oh yes, this was a 50-MHz-only DXpedition) to see what Don Search will say for DXCC. I think that my operation in 1983 is the only time that contact has been made between FG and W3 on six since the mid-70s.

I know of a case in which a local ham (now deceased) - running high power - usually worked DX stations a second time just after his own success, using the call of one of his buddies on the second QSO. Since neither the station nor the operator of the second call were present, this seems like a clear violation.

You will note that the first two recipients of the DXCC award on 6 meters were K5FF and W5FF (wife and husband, repectively). I have never heard a single suggestion that either ever worked a DX station using the other's call.
Lee and Fred Fish certainly share the same rig.

The card for WL8E was likely intended for WL7E, who is pretty active.
But even if you forwarded the card to WL7E, it probably wouldn't do
him much good.

My personal opinion: if someone I contact can't copy my call right, they
probably don't deserve a QSL. I would take the aforementioned cards,
draw a line through the W8 callsign, write "station unknown" or "return
to sender" on them and send them back via the ARRL outgoing bureau.

Once again, we see a perfect demonstration of a most unfortunate flaw of human nature. That's the ability of war to induce mass hysteria in an otherwise rational population, turning them into sheep that readily accept the destruction of the moral principles for which they claim to fight.

Nowhere in the Constitution do I see a wartime exemption to the First Amendment. Whether you support or oppose the war, your right to express your opinion is protected. If you feel that people should be prosecuted merely for publicly opposing the policies of their government, then please explain to me why you are so morally superior to Saddam Hussein.

Ahem. Be that as it may... the point of W3IWI's posting was not to debate the merits of a particular posting about the war. He was calling attention to the FCC's unrealistic policy of holding each and every PBBS, digipeater, or repeater licensee responsible for every message that passes through them, as opposed to holding only the originator responsible.

Phil

I've heard him on 145.55 for over a week now, on every orbit that I've listened for it (at least 10). That was his usual voice frequency before he started on packet, I expect him to stay on it. He was probably playing with it when it was on the other frequencies.

I managed to leave him (Musa) a mail message on Tuesday night (after trying to connect for 3 orbits), and he left a reply that I picked up Wednesday. I also managed to get the help list for the commands down and am including it here to (hopefully) help reduce the amount of time people spend during a pass just getting the help file. So keep this handy for when you get connected.

Analysis of the downlink shows that he probably has RETRIES set to 5 and FRACK set to 4. If you see packets addressed to CQ, that means whoever was on just got timed out and it is open for someone to connect. If someone is connected please don't try to connect, it is only a single user system and you will either cause problems for the connected person or get a busy disconnect if he hears you. At times 90% of the downlink traffic is busy disconnect frames to everyone trying to get connected while someone is already on.

The 'S' command doesn't need a callsign, if omitted, U2MIR is used.

I don't know how its actually done so I feel free to comment :-)

I would take a GPS receiver to some known point in the vicinity, like the U.S. embassy, and measure that point VERY accuratly. The rest can easily be scaled from satellite photos.

A course in navigation gives about a dozen ways to find your position by observing the transit of satellites in a known orbit or similar such events. I would expect that given the time that was available the information was cross checked by most of these methods.

Obviously the information was quite accurate :-)

>Jim Grubs, W8GRT - Support OPERATION DESERT STORM - the 9th Crusade!

I really hope that Jim meant this in jest! He certainly should know better if not.

For the unititiated, the crusades were one of the ugliest parts of the history of Christianity. Mostly for political purposes under the guise of religion they resulted in a greast many of the problems that thw world is still struggling with today.

Much of the hatred of "infidels" in the arab world today can be directly atributed to the appalling abuses on the native population by "Christians" during that era. Kept alive by some incredibly insensitive and inept politics on the part of Europeans and more recetly by the ambitions of power hungry Arab leaders.

I have no sympathy for Saddam Hussein, there are a great many parallels between his actions and those of Adilf Hitler, but a "9th Crusade" is hardly a good motivation for our Arabic/Islamic allies! Nor I might add our Jewish ones.

I apologize if this comes across in a heated tone, it was not intended to be a flame in any sense. I do feel strongly that the record needs setting straight however lest we get lost in a lot of pious nonsense once again.

Followups via E-mail since this is not related to any of the groups I read.

Recently, I asked my brother (another radio amateur) how he wanted get together for Field Day this year. A couple of years ago I spent the weekend playing radio (not in the contest) from a friends cabin located on top of a ridge overlooking the Kern River Valley. Normally, there is a lake in the valley known as Lake Isabella, but, as of last September, the lake is dry.

I asked if possibly we should try to run a serious Field Day effort. Here is his reply:
rec.ham-radio please help us write the rules for the alternative field day?

**** start of included text ****

Subject: Field day and Laguna Seca
Status: R

I say we have our own points system based upon how many contacts made per how many beers consumed. This means we keep track of how many beers we drink at what time, then look at the logbook (logbook?) and give points to each contact based upon how sauced we were when doing the contact, and how much useful information we were able to record from the QSO. An extra bonus point should be given if a QSO is successfully performed with another intoxicated operator.
Also, a special points category, Coffee Induced QSO points will be structured to deal with QSOs made after drinking a pot of Kenya made Daren-style.
[ed: Daren-style is about 4 times too strong for people who like strong coffee]
Myself, I prefer the luxury of being indoors at a place like [name of person who owns cabin], where there is a refrigerator to keep the brews cold.

**** end of included text ****

Daren (my brother) has asked me to solicit input regarding his alternative points system. He has also asked if other amateurs are interested in

participating in this "contest in a contest". Please reply privately
to me with any input, even the phone number of the local Al-Anon chapter.

****
***   GEOMAGNETIC STORM WARNING UPDATE   ***
****

01 February, 1991

Informational Update

ATTENTION:

Further analysis has been performed on potential impacts from the major energetic flare of 31 January. A major geomagnetic storm is still anticipated. The main phase of the storm is expected to occur either late on 01 February (UT time) or early on 02 February. A sudden storm commencement (SSC) is expected to precede this storm.

The intensity of the predicted storm has been downgraded from potential planetary A-index values of 80 to betweeen 40 and 65. Higher latitudes will experience more intensive storming and higher magnetic A-index values. Translated, these figures mean that middle and low latitudes will experience major to high-intensity minor storming. A risk does still exist for possible brief bursts of severe storming over middle and low latitudes, although this is looking less likely now than it did 24 hours ago. High latitudes will experience major storming with possible frequent periods of severe storming.

People should note that the accuracy of predicting magnetic activity from major flares is a very difficult task dependent on many unknowns. Hence, there is a risk that the magnetic storm may not be quite as intense as is predicted. On the other hand, there is also a risk that magnetic storming could exceed the values predicted.

ALL OF THE WARNINGS WHICH WERE ISSUED ON 31 JANUARY REMAIN IN EFFECT. The probability for a magnetic storm is very high (80% or better). People who could be affected should continue to be on the alert for changes in conditions. A magnetic storm alert will be posted if magnetic storming occurs.

To calm the fears which these warnings may have caused for people who are unaware or uneducated about these types of phenomena, please note that these events pose no threat to humans. They do represent significant threats, however, to the equipment and networks which we have established on earth. Communications is particularly susceptible to heavy impacts. However, no one should worry about receiving dangerous doses of radiation or other dangerous elements from the major flares and geomagnetic storms which occur. The earth has excellent natural protection mechanisms to protect us against any harm. Unfortunately, the equipment we have established and use (such as the electricity we consume, communications and satellite functions) can be threatened by this sort of activity. Damage to the equipment of susceptible industries can occur if appropriate safeguards are not taken. This is the reason the warnings are issued.

Additional information: Satellite altitude protons increased to event levels at 06:00 UT on 31 January. They peaked at 240 p.f.u. at 16:20 UT on 31 January. They have been declining since then and are now at levels below 65 p.f.u. (still way above the event threshold). They are expected to continue declining unless another major proton flare occurs.

A polar cap absorption (PCA) event occurred on 31 January and is presently in progress. Significant degradation in high-latitude and polar region radio propagation has resulted and is expected to continue for the next 36 to 48 hours (after the magnetic storm has passed). Significant degradation in middle and low latitude radio propagation conditions are still expected during the main phase of the expected geomagnetic storm on 02 February. Near blackout conditions could be experienced over the polar and high latitude regions, particularly during the sunlit periods of the day. Middle and low latitudes will suffer significant absorption, noise and very strong signal flutter and fading. However, there is a good possibility for some auroral backscatter communications on VHF frequencies over middle and high latitudes (possibly even stretching into the lower latitudes). Radio conditions should begin returning to more normal conditions during the post-storm residual magnetic activity, sometime late on 03 January to 04 January.

Auroral storming is expected to begin sometime during the evening hours on 02 February for North American observers. Observers in the UK and Europe should witness the onset of the main phase of the geomagnetic and auroral storm in the early morning hours of 02 February (local time - possibly earlier). The leading edge of the auroral zone is expected to migrate southward to lie over regions near 45 to 55 degrees north latitude (there is a slight risk it could migrate further south, but this is not currently anticipated). Low latitude auroral observations will be possible during the main phase of this storm, particularly during the moonless hours of the evenings (the moon rises roughly around 21:00 local time on 02 February).

Reports of auroral and/or radio condition observations would be appreciated. Please send descriptive reports (stating location, observation time, and observational summaries) to "std_oler@hg.uleth.ca". Thanks.

Major flaring is still very likely over the next 24 to 72 hours. Several regions (namely, regions 6462 (S18W57), 6466 (S09W53), 6469 (S13W40), and 6471 (S12E02)) remain very capable of producing major energetic activity. There is still a high probability for further proton flaring from any of these regions. Hence, the risk for future strong satellite proton events and/or PCA event activity remains high.

... or Saddam reads Aviation Week, for instance. About 10 years ago, I worked for a certain US Gov't security agency. I was assigned to work on a project involving satellite technology. I was given a copy of Aviation Week to read as a primer on the project. Funny thing was that the project had a classification level of Secret.

You may be assured that discussing the characteristics of GPS here is not going to yield any information that Iraq's military doesn't already know.

If you are copying military RTTY broadcasts, they are encrypted and will
print pure garbage. I am not sure the military still uses HF RTTY
broadcasts, but they did about 15 years ago. The shifts were 170 Hz,
the characters were 5-level baudot and for all purposes and intents were
real characters. It just looked like a monkey was at the keys!

G'day radio folks.

I'm considering buying a dual-band (2m/70cm) transceiver for my car,
and I am wondering which one to buy.

So far I am aware of the Icom IC-3220 and IC-2400, Yaesu FT-4700 and two
models by Kenwood (I forget their numbers for the moment, but I believe
they are similar to Icom's two radios).

Are there any other brands/models that I should consider?

Has anyone heard of new models soon to be released that are worthy of
a short wait?

Does anyone have any comments to make on any of these radios?

Do any of them have extra (bonus/freebie) features that I should be aware of (eg wide-band receive etc)?

Does anyone have any comments from a users perspective (eg are they 'user friendly', easy to operate in the dark / while mobile, do the knobs fall off, etc)?

I recently bought an IC-24AT HT and am now sold on the idea of dual-band radios. This is a great little radio, although in my opinion it is just a touch 'user un-friendly'. Specs-wise it's terrific.

Thanks in advance

Even easier, if he has a GPS receiver, it's all explained in the manual.
At least it is in the manuals for the ones we have.

With all the recent talk regarding the R390A, I thought now would be the appropriate time to ask this question:

How do you connect two R390As in diversity mode? The manuals I have only show a block diagram with no details. I would like to know exactly what do I have to do to connect two of these in diversity mode...

Anyone have any information on this?

Thanks

Certainly, one of the major purposes of the Ninth Crusade should be to clean up the mess left behind by the first eight.... We can hope anyway.

In any event, my point was to call attention to the fact that possibly Saddam Hussein but certainly many other moslem leaders do, as you pointed out, think of the present situation as an outgrowth of and continuation of the struggles that began in the 11th century. It also was intended to call attention to the fact that people in the Middle East hold a grudge longer than most anyone else you can think of.

If Iraqi agents can read Usenet news then they surely have better ways of getting information on GPS, such as any university library. Or should we just shut down the whole frigging net until the war is over?

I've stopped being amazed by people who want to censor information that is already widely available; they're just too numerous.

You're willing to endanger lives just to prove you have a right to shoot your mouth off anytime you choose? Being 'right' about abstract consitutional principles is not worth somebody's life. It would be different if you were gambling only YOUR life. You're playing games with someone else's life.

I'm trying to build the 10-element BC band filter from the back of the '90 ARRL Handbook. I was able to procure all of the other components at Electronics Plus in San Rafel [close to work], but they didn't carry 2.5% capacitors.

So, suggestions? I'm willing to mail-order. I need 7 of them, which should help with a "minimum order" situtation.. I have the feeling that they're not going to be cheap. Bay Area walk-in places preferred.

Of course, having 1250AM blasting all over my SW reciever is no fun, so
what the hay. My soldering iron has been lonely recently.

Thanks in advance.

"NA-85" sounds like an IOTA designator, which is a
two-letter continent followed by a number. IOTA stands for
Islands On The Air, and is a program similar to DXCC
sponcered by (I believe) the RSGB. Essentially, any island
anywere qualifies as a "country". As you can imagine, there
are many more islands than DXCC countries. This makes IOTA
much more chalanging - it would be pretty hard to have
worked all the islands in the world. It also makes for
cheap DXpeditions -- Catalina Is, 30 mi sw of Los Angeles,
for example. If you hear a pileup on some otherwise not
rare DX, he may be on a new IOTA island.

|>brews
|>cold.
|>

I think you probably need some category multipliers. For example, the guy who can pull off a successful QSO without RF burns over 90% of his body after 5 shots of grain alcohol deserves more points than the guy who just had 5 Lites.

Probably three divisions:

A - people drinking hard liquor or drinks composed of greater than 50% hard liquor by volume. (3x multiplier)

B - people drinking standard beer. (2x)

C - people drinking lite beer or drinks with little paper umbrellas in them (1x)

and maybe a fourth division

D - people drinking bottled spring water (0x)

Total field day score to be multiplied by the appropriate number before submission.

SB SPACE @ ALLBBS < KD2BD $SPC0204
* SpaceNews 04-Feb-91 *

Bulletin ID: $SPC0204

SpaceNews

MONDAY FEBRUARY 4, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* U2MIR-1 NEWS *

Packet Radio (AX.25) communications from Mir appear to be taking place on a regular basis over a frequency of 145.550 MHz. A brief connection with U2MIR-1 was made by KD2BD on 28-Jan-91 at 16:59:25 UTC using an indoor 4-element quagi and 7 watts of transmitter power. Signals from Mir are STRONG. U2MIR is probably running at a power level of 20 watts.

A large number of stations have been able to connect with Mir. The TNC in use on Mir can be said to have a very short "fuse". Packets are sent very rapidly, and if acknowlegements are not received within a short period of time, U2MIR-1 sends disconnect frames and clears its buffers through its unprotocol address (CQ). Groundstations can also digipeat through either U2MIR or U2MIR-1.

Once connected to U2MIR-1, the BBS responds as follows:

```
  Logged on to U2MIR's Personal Message System

  CMD(B/H/J/K/KM/L/M/R/S/SR/V/?)>
```

Successful mail sessions are ended with a response such as:

```
  Message saved as Msg # 78
```

The U2MIR-1 BBS also keeps a journal of all stations heard and connected to, but the clock and calendar of this function does not yet seem to be set. For example, log listings are given as:

```
  KA9NMD         00/00/00 00:00
  KD2BD          00/00/00 00:00
```

Stations wishing to connect with U2MIR-1 should bear in mind that Musa may come on voice at any time, so it is considered a BAD practice to send connect packets until packet signals from U2MIR are first heard. There also seems to be a very large variation in downlink signals from Mir. It is sometimes helpful to open your receiver squelch during weak signal periods to prevent your TNC from sending packets and exceeding its retry count without having a chance of being heard by U2MIR due to changes in spacecraft attitude and the resulting QSB. Programmable transceivers should be used to transmit 5 KHz lower and receive 5 KHz higher than 145.550 MHz at the time of AOS, move to 145.550 MHz at TCA, and receive low and transmit high until LOS, in order to compensate for doppler effect.

* NOAA SATELLITES *

NOAA weather satellites transmit weather images taken in both visible and infra-red light from low-Earth orbit on a regular basis. NOAA-12 is expected to be launched on 14-May-91 at 1552 UTC.

The current series of NOAA satellites transmit APT on the following VHF frequencies:

NOAA- 9: 137.620 MHz
NOAA-10: 137.500 MHz
NOAA-11: 137.620 MHz

Odd numbered NOAA satellites can be copied during the mid-afternoon and early morning hours. Even numbered NOAAs can be copied during the mid-morning and mid-evening hours, local time.

* NOAA NEWS *

NOAA is developing a directory of resources for earth observation in education. The directory is one of several educational projects NOAA is undertaking as part of International Space Year (ISY) - 1992. The directory will serve as a resource on how imagery from environmental satellites is being used in schools to enhance learning. The core of the directory will consist of a listing of schools worldwide that use real time satellite imagery with a brief description of how the imagery is used in classroom instruction. In addition, the directory will contain a section on curriculum materials developed by teachers, a listing of current manufacturers of hardware and software for receiving and processing satellite images, and a bibliography on educational applications of environmental satellites.

Any information that the users of NOAA satellite data, can provide in support of this effort would be greatly appreciated. If you know of any schools or teachers who are using environmental satellite data in their curriculum, please let NOAA know. Drop a letter or postcard to NOAA Educational Affairs Office, Federal Building #4 Room 0158, Washington, DC 20233; or call 301-763-4690 (24 hours a day) and leave a message with Ms.

Arlette Washington.

15 years ago most military (Army at least) rtty was 850hz shift. They were just starting to move at that time to what they liked to call NSK (Narrow Shift Keying) at 85hz. Too the best of my knowledge the primary users of 170hz shift was and is hams. (Of course MARS used ham gear and therefore 170hz.)

Well lets see. Most basic is the "straight key" which is what I think you mean by "telegraph-style key". Generally with some form of up/down motion and endless variants. Push down you send a signal (mark) let go you stop (space). Most modern versions are based on the WW-II "J-38" key which had two flat disks to grip with and a good, adjustable action. Works well (with practice) up to about 20 wpm. When you read about a cw operator's "fist", generally this refers to a "straight key" since this is by far the most distinctive by personality.

Generally a "bug" (now obsolete) was a "semi-automatic" key which had a system of weights on a spring which would oscillate to produce the dits when the paddle was pushed to one side,
dahs were produced manually by pushing the paddle to the opposite side. Vibroplex the major (only?) manufacturer produced both a left and right handed version which essentially switched the side for dits and dahs. Never used one personally, but I have heard good cw sent at 50wpm from a bug. I have also heard some awfull pretense at cw from them. The most common error was to set the dits fast (40wpm) and try to send at 10wpm. There were also "swing" styles which essentially were other alterations in the proper spacings, mostly resulting in unreadable cw!

Electronic keyers come in just about every variety, from electronic "bugs" to keyboards. What is most popular (what *I* use :-)) is an "iambic keyer" which has two paddles, one dits, one dahs. When you squeeze both the keyer sends didadidada so one motion can send K, R, C, etc. A squeeze releasing one paddle will send characters like Y and Q. All dits, dahs and "letter" spaces are "self completing" which means that the keyer won't start the next element until BOTH mark and space are finished. The object is to send properly spaced cw with a minimum of hand movement and as much allowance for human timing error as possible. No easier to use than a "bug" or "straight key", but you can send much faster and for a longer period of time with an electronic keyer.
To change speeds you must adjust the keyer or send charachters at say 20 wpm with spacing to 5 or 10 wpm. This works ok if there isn't a great deal of speed difference and is very readable. Characxters at say 30 wpm spaced at 5 wpm don't cut it since most "low speed" cw ops won't hear the characters!

My advise to a beginner, start with a straight key. Plan to use it for 6 mos to a year until your speed gets up to 15-20wpm then get an electronic keyer. Practice OFF THE AIR with the keyer until it is second nature, then try it on the air. Figure about two years more or less daily use of cw to get to 25-35 wpm, sooner if you spend more time at it and deliberatly "stretch" yourself. I found cassette tapes at about 20 wpm very good to listen to as I drove. I didn't try to copy everything, just listen, but after a few weeks I got more and more of the text.

People can say what they like about how no-code will increase the number of hams. I say, bring a few buddies along to Field Day and they will be 'hams' for life!

Actual W6YL Field Day QSO at 4:30 AM sunday morning:

"Queue aRe Zed Field Day this is Whiskey Sex (er, 6) Young Lust..."

Some poor soul somewhere in Tennessee:

"er, um, this is, er, um, this is, er, um, Why are we *doing* this???"

Steve, AC6P, at the mike, Walt, KK6NR, logging:

"I don't know... We're cold... We're tired... We're hungry...
We want to sleep......   What call should I use?"

Field Day *is* ham radio!

Hello, Netlanders and SW enthusiasts:

Public Service Announcement from The Christian Science Publishing Society (producer of The World Service of The Christian Science Monitor):

In ads published in The Christian Science Monitor newspaper, readers are invited to:

"Send A Shortwave Receiver To Someone In The Service Overseas.

"For a limited time only (until May 1, 1991), we will give you the opportunity to send a shortwave radio receiver to service personnel overseas, priced at our cost--and we will pay the postage. This offer is available only for direct shipment to FPO and APO adresses.

"Sangean ATS-803A Digital World Band Receiver: special overseas service price $123.00

"Sangean MS-103A World Band Receiver Shortwave Starter Set (includes radio and 1991 edition of "Passport to World Band Radio"): special overaseas service price $65.00

The same equipment is available for delivery to non-APO or FPO addresses at $189.00 and $115.00, respectively. "Passport to World Band Radio" is also available at $16.95. Shipping charges are added to domestic deliveries.

To order, or to get more information, call 1-800-448-2466.

The last word I heard was that accuracy had actually improved, because the
US military forces in the Gulf are making extensive use of commercial
Navstar receivers, while the Iraqis have little or no Navstar equipment,
so the public-access code is being kept as undegraded as possible.

Why bother?  There is nothing secret about any of this.  There is nothing
to be gained, and a fair bit to be lost, by keeping the public in ignorance
of things Saddam already knows.

Hmmm - interesting question. I know that some of the EME crowd (Earth-Moon-Earth, or Moonbounce) used to do this - go on expeditions for their needed states, making sure the home station worked themselves. So I guess there is a precedent, right or wrong.

There was some flak a while back when they re-wrote the part 97 rules. A clarification came out that said a host op could 'lend' his station to a guest op, such that the guest op's callsign could be used for a weekend contest ("Derek, I'll buy your station for $1, but I'll sell it back to you Monday a.m. at 0000Z). This, however, is not the same case as above. Any home lawyers out there?

The Japanese are giving the majority exactly what they, the majority, have asked for. I am somewhat distressed by all the entries in rec.hamradio

made by people wanting very wideband fromt ends, it is as if they wanted
scanners and were prepared to accept a very poor built-in 2m transciever.

Here in the UK, I'm well away from kilowatt alley, but we do have many
rock-crushing SW broadcasters. When I have let other radio amateurs have
a go with a good professional Rx of very high 3rd order intercept point,
they have always commented that the bands have sounded dead. It is as if
the majority of people want high background noise levels because they
associate them with good conditions. People with only poor receivers cannot
know what they are missing because they cannot hear it !

If good receivers seem dead to the majority, how could a good RX be
demonstrated in a shop - the punters will suspect bullshit being used to try
to fob them off with a deaf rig. Some sort of comparative clarity tese
oops, this editor... sorry,   test is needed, but even this will look like
a fix-up.

The manufacturers have recognised that features and flashing lights can
be unambiguously demonstrated, unlike good old raw performance. Reviewers
tend to be spineless and never tell people what they are missing. To be
fair, they ply a minefield of litigation and advertising revenew, and have
to be careful not to drive readers away with technical writing.

Those of us who do understand these things have, i feel, a duty to
explain and demonstrate in careful, diplomatic ways what is missing.

Thad

I don't have either one of my 735's open and I can't seem to find the
precise location or information but roughly...

There are two diodes, D30 &D31 (or maybe it's D32&D33 D34&D35 I can't
remember) located toward the front center of the board containing the
CPU. The diodes were end mounted with yellow insulation over the end of the
leads away from the board. Cutting these diodes out of the circuit enables
broadband transmit. My radios were purchased new in spring of 1989 so
I don't know if they acurately reflect current production units.
This is a particularly nice feature since it allows wide coverage when
used with transverters. I use my 735's with my 144MHZ - 10.368 GHz transverters
with the radios operating in the 20-30 MHz region. It allows 10 MHz of
all-mode coverage on every vhf-uhf-uwave amateur band.

Does anyone know whether there's a mod to extend transmit coverage of
the Alinco 70cm FM mobile rig (DR410T if memory serves) so as to cover
frequencies in the 430Hz range. It's advertised as 440-450 only on transmit.

On a similar theme anyone know of a (probably difficult) mod to make the
Yaesu FT790R (not the later FT790RII) cover 440-450MHz in addition to
it's standard 430-440MHz.

Please respond by email if posible, I will summarise for the net,
our news server is having capacity problems lately.

Thanks and best 73s old top.

Last week I posted a request to the net asking what the current FCC regulations were for low-powered FM broadcasting. As you may recall, I wanted to pipe CNN audio around a building.

I was primarily interested in what levels of intentional radiation were allowed outside the property line of a privately-owned industrial area. Unfortunately, there either does not exist such a regulation or none has been found. I believe there must be such a regulation, because our EMI test lab generates field strengths far in excess of the limits in Part 15. These emissions are legal because they are self-contained. I would still like to find out what the FCC says about this. By the way, there is such a rule for AM stations on a school campus. The emissions are not limited except at the perimeter of the campus. (Hey, they teach college credit courses here; does that qualify Tek as a school campus?)

The only regulations anybody could find that pertain to the FM band apply to operation at any location, including a neighborhood. Hence, these are quite restrictive. I wish to thank gary_t_trindl@cup.portal.com for faxing me the pertinent pages of CFR 47 Ch. 1 (10-1-89 edition) Part 15. It reads:

15.239 Operation in the band 88-108 MHz.

(a) Emissions from the intentional radiator shall be confined within a band 200 kHz wide centered on the operating frequency. The 200 kHz band shall lie wholly within the frequency range of 88-108 MHz.

(b) The field strength of any emissions within the permitted 200 kHz band shall not exceed 250 microvolts/meter at 3 meters. The emission limit in this paragraph is based on measurement instrumentation employing an average detector. The provisions in 15.35 for limiting peak emissions apply. [I don't have a copy of 15.35, but since the operation is FM, I doubt this limit would apply--WKM]

(c) The field strength of any emissions radiated on any frequency outside of the specified 200 kHz band shall not exceed the general radiated emission limits in 15.209. [see below--WKM]

(d) [omitted, only applies to custom-built telemetry equipment--WKM]

15.209 Radiated emission limits; general requirements.

(a) Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

Comments:

250 uV/m @ 3m is hardly any higher than the unintentional level most computing equipment is allowed to put out. I believe this is not enough to cut through the computer-generated hash in the building where I work. It might be possible to install transmitters every 25 feet, but this is impractical. I might try to set up something that would cover a small portion of the building.

Some people have suggested carrier-current AM. This would not work here for two reasons. First, the computer generated hash is much greater at 1 MHz than 100 MHz, and AM is more susceptible to noise. Second, the power distribution system here would not propagate the signal beyond a small area.

Several people have pointed out that rebroadcasting CNN would violate copyright law (however I doubt CNN would pursue it).

Thanks to everyone who responded. If anyone has an answer to my first

question (as stated at the beginning of this article), please let me
know.

Dube, A bidirectional antenna would find the null in "one" place. the earth
is ROUND. This may be news to some folks, but I thought you knew. :-)

all kidding aside, It is possible, even with a unidirectional antenna to
get a signal via long-path that you cannot rx directly. It is a good idea
when dfing to assume nothing and use a bidirectional antenna from 2 or 3
locations (far away locations) and allow the intersection of the reports
given by these stations determine the location of the xmitter.

>
> 73,
> Dube   N5PDK

I disagree. Why do we need to differentiate. If the reason is to "self police", well,
there are plenty of people who have retained their call sign even though they have
upgraded. Myself, for example. I hold a technician class license with a novice call.
If you heard me operate on 2M you would not know, by call alone, if I was
entitled to be there. Even checking the call book is not good enough, I could have
upgraded since it was published.

To me, the answer is not to look for a special identifier (by the way we would need
a bunch of them for all the different types of technicians there are, 5 by my last
count). Rather one needs to get a feel for how someone on the air is operating. Are
they polite ? Do they follow good operating procedure ? Are they confused or
willfully interfering ?? etc.. Then try to lend a helping hand. Only as a last resort,
if that doesn't work, appropriate action can be taken.

A ham is a ham is a ham is a ham. Let's open up and accept our new members....

Hi,
I recently came accross this most interesting piece in my ARC publication. I have received permission from the author to "re-print" it here. Please note that I retyped the whole thing by hand and any "typos" are my responsiblity alone.

I believe it is a thought provoking conversation provoking article. My intent is not to startup another flame war, but to encourage an adult exchange regarding freedom of speech and radio.

Please post your comments. I will summarize them and give the original author your feedback.

Freedom of Speech and Amateur Radio

There has been much concern in recent years regarding declining interest among the general public to become involved in amateur radio. Surprisingly, this comes at a time when the Cold War has ended and communications between amateurs in this country and those behind the former Iron Curtain are enjoying a renaissance. What can explain this anomoly ? Isn't the general public aware that amateur radio enables them to speak directly to Lithuanians and Hungarians, rather than having to rely on new reports ? Surely amateur radio should be attracting new devotees in droves.

The fact is that his is not happening and I believe I have pinpointed one of the reasons. 47 CFR &97.117 states:"Transmissions to a different country, where permitted, shall be made in plain language and shall be limited to messages to a technical nature relating to tests, and, to remarks of a personal character for which, by reason of their unimportance, recourse to the public telecommunications service is not justified." What attraction is there for the general public to spend thousands of dollars on an amateur radio station just to be able to say "5-9, New York" to a Russian ham ?

Section 97.117 degraded amateur communications to unimportant remarks of a personal character -- remarks so unimportant you wouldn't even waste a phone call on them. Thus, there is a built-in damper on any interesting communication on the amateur bands.

Now, I know that the genesis of this provision is an ITU regulation, and I understand the politics of protecting common carriers from lost revenue. I also am aware that this regulation is violated every minute of every day. But it seems to me that amateur radio will never thrive as long as there is a gag order on intelligent conversation.

I think that we wouldn't have to be concerned about losing amateur frequencies if we could use the frequencies for more than experiments and contests. Section 97.1 of the amateur rules provides that one of the purposes of the amateur service is "continuation and extension of the amateur's unique ability to enhance international goodwill." How can we accomplish that through "remarks of a personal character for which, by reason of their unimportance, recourse to the public telecommunications service is not justified."?

I think that we should be going into WARC-92 with a proposal to eliminate this provision. In addition, we should esamine carefully the restriction on free speech which the FCC imposes on domestic amateur communication.

For example in &97.113, it says:"No station shall transmit communications as an alternative to other authorized radio services, except as necessary to providing emergency communications." Under this regulation, the existance of call-in talk radio programs on broadcast station would seem to prohibit most discussion nets, since the net control is performing the same role as a Larry King in that type of net.

In fact, just about all of &97.113 is of questionable value. While it is clear that an "amateur" service should be free of business communications in the strict sense of communications which facilitate financial gain by someone, why should it be prohibited for a radio club to use the amateur bands to anounce the next club meeting ? The FCC considers such communications to be business communications despite the fact that the beneficiary is a non-profit organization. (Ifi you have any doubts regarding the FCC position on this, talk to Glenn Baxter, K1MAN, who was cited by the FCC for violating this rule by talking ut the Amateur RAdio Peace Corps.)

While I certainly agree that communications for hire, and obscene communications should be prohibited on the amateur bands, it is not clear to me why the playing of music should be prohibited in a two-way communication. The existence of regulations like 97.113 and 97.117 has turned many hams into amateur attorneys, having to interpret the rules to decide what speech is permissible and what is not.

The truth is that amateur radio will not thrive untill all speech of a non-obscene and non-commercial nature is permitted on the amateur bands. What better way to demonstrate to the newly-democratic Eastern bloc the freedom of speech which has been the glory of this nation than to fight at WARC-92 for the freedom of speech in amateur radio. When hams can legally have intelligent discussions on HF, interest in amateur radio will rebound. When we can legally offer new hams more than just call signs and signal reports, there will be a good reason to get involved in amateur radio -- stimulating conversation with people all over the world. And that's the reason many of us became involved in amateur radio to begin with.

FRANK TERRANELLA is an attorney and amateur radio operator.

&97.103 Station licensee responsibilities.

a) The station licensee is responsible for the proper operation of the station in accordance with the FCC Rules. When the control operator is a different amateur operator than the station licensee, both persons are equally responsible for proper operation of the station.

&97.105 Control operator duties.

b) A station may only be operated in the manner and to the extent permitted by the privileges authorized for the class of operator license held by the control operator.

&97.119 Station Identification.

d) When the operator license class held by the control operator exceeds that of the station license, an indicator consisting of the call sign assigned to the control operator's station must be included after the call sign.

ARRL says on Page 6-4 of The FCC Rule Book C. 1989

> You may simply "lend" your equipment to your visitor, and the equipment in your shack then becomes your visitor's temporary station. Your visitor signs his own call and operates within the privileges of his license.

When this question first hit rec.ham-radio, I was sure that I'd run across the answer while preparing for Elements 2, 3A, and 3B recently. After searching through the materials I have, the best I can come up with is question 3A-4.1 in the Element 3B question pool which says that a General operator using a Novice station on 7250 kHz should identify using the Novice-station-call / General-operator-call. There is a reference to {97.119(d)} with the answer to the question, but, unfortunately, my only copy of Part 97 is printed in a 1966 version of "The Radio Amateur's License Manual" from ARRL that I still have from my early days of interest in ham radio. And that version of Part 97 is quite different from today's rules! For example, the 1966 version of Part 97 prohibits the Novice station from being operated outside of the Novice bands regardless of the license class of the operator.

In any case, I would be interested in the one true answer to this question and look forward to seeing it here.

BTW, I passed Elements 2, 3A, 3B, and 1C. Now begins the long wait for the callsign! And more studying so that the CSCE for 1C doesn't go to waste!

This is from memory from a while back, and is only recollection, but, actually (i don't have rules handy, so don't let the rec.ham-radio police know) you are SUPPOSED to identify with the station license. This changes if you operation provlidges are greater than the host station operators privlidges, in which case you are supposed to identify as BOTH if you operate in an area outside of normal privlidges for the host station but inside your privlidges for operation.

This gets rather mucky, especially in the case of multi-ham family stations. In that case, it was always looked upon as a multi-station environment, and the equipment was 'loaned' from one station to another, even though there wasn't any physical transfer of equipment.

There is nothing in the rules that says you CAN'T id with both, even if in the minimal operational privlidges of the host station, but it was (at least before the last rules rewrite) pretty explicit that you WOULD use the station ID, not operator ID.

But then, you could always claim you borrowed the station, and sign 'portable x' on your call as not being at your base. But then (I know, are you counting the times I say 'but then'?) since the rules on ID for portable and mobile have been relaxed in practice lately....

There was another guy in California about 3 years ago who walked into a TV station with a gun and demanded that the reporter read a prepared paper about how the US government knows about the existance of UFO's. The speech never went on the air because the anchorman stalled, but it was later printed in newspapers around the country (I read it in the Syracuse Herald Journal, plus saw the video clips of the guy with the gun).

I have a 2X4FZ Comet antenna...the shorter version (7db UHF/4.5db VHF) like
the construction but have yet to get it in the air due to weather...am also
looking for comments on that one! I have heard from users of the 2X4 big
version that is does perform!!!

> there for the general public to spend thousands of dollars on an amateur radio station just to be able to say "5-9, New York" to a Russian ham ?

> Section 97.117 degraded amateur communications to unimportant remarks of a personal character -- remarks so unimportant you wouldn't even waste a phone call on them. Thus, there is a built-in damper on any interesting communication on the amateur bands.

Your re-wording of the regulation is very poor.

You can talk about many, many things that are not important enough for you to spend the money to call a stranger in a distant land. How many people would call Russia to talk about chess or their latest homebrew project or anything else with a total stranger?

The regulation is designed to prevent a husband/wife pair who are separated vast distances from using amateur radio to discuss the kids and thus avoid the use of telephones (which would be a better medium, anyway).

> But it seems to me that amateur radio will never thrive as long as there is a gag order on intelligent conversation.

It is too bad you think that regulation is a gag on intelligent conversation. It isn't. You miss the difference between "not interesting/not intelligent" and "unimportant".

> How can we accomplish that through "remarks of a personal character for which, by reason of their unimportance, recourse to the public telecommunications service is not justified."?

It takes something pretty damn important to justify calling Russia. There is a world of topics that fall below this level of importance.

> When hams can legally have intelligent discussions on HF, interest in amateur radio will rebound. When we can legally offer new hams more than just call signs and signal reports, there will be a good reason to get involved in amateur radio -- stimulating conversation with people all over the world. And that's the reason many of us became involved in amateur radio to begin with.

That "when" is today. You have an extremely NARROW view of the rules. Maybe YOU think it is a trivial matter to call people you have never met who live in foreign countries, but there are a lot of us who don't. YOU may call them up to talk about your latest operation or your new radio, but the rest of us don't. There is a huge amount of information that is not important enough to call about. "5-9 New York" is not even scratching the surface.

> FRANK TERRANELLA is an attorney and amateur radio operator.

Heaven save us from the attorney/hams.

I have one of these on order....

The only problem is that they are not in stock at any store that I could
find. A shipment is due to arrive on about Feb 15, well that is what
kenwood says anyway!!!

>turn the dial?

Like most radios, the BFO frequency is different for CW than it is for USB. That's why you have to retune for best audio. The TS-850 is no different here. The amount of retuning will vary, however, with the BFO offset which is adjustable from 400 to 1000 hz in the 850. I suspect that at 1000 Hz the amount of retuning would be somewhat less than what you may be accustomed to on other rigs. BTW, the psuedo-standard CW offset these days is 800 Hz.

>2) Is there a separate transverter jack on the back? If so:
>   a) how much power does it provide?
>   b) is it TX or TX/RX?

No, there's not a separate transverter jack per se, but the setup works like this. If you desire a "drive level" output from the rig, the manual gives instructions on how to move a coax jumper cable inside the rig to change the IF OUT jace to be DRIVE OUT for a transverter. Doing this, however, disables the IF OUT so you could not, for instance, still use your band scope in conjunction with a drive-level transverter. The manual states that between 0 and 10 dBm are available at this connector. RX is still through the regular antenna connector.

There's also a description and drawing of applying +8 to +12 volts through an RF choke into the DRIVE OUT line to operate a relay inside the 850. The description further states "Note that when no voltage is applied, power is still output from the ANT connector during transmission".

As a final followup to the series, here are the specifications for the Kenwood TS-850S as quoted from the owner's manual.

GENERAL

Memory Channels	100
Antenna Impedance	20 ~ 150 Ohms w/ AT-850 installed
Power	12 ~ 16 VDC 2A (receive) 20.5A (Xmit)
Freq Stability	+- 10 PPM
Freq Accuracy	+- 10 PPM
Dimensions (incl. projections)	339 x 135 x 375mm (13-11/32 x 5-5/16 x 14-3/4")
Weight (with/without AT-850)	10.9kg (24 lbs) / 9.4 kg (20.7 lbs)
Base Price as of 1/29/91 (incl. AT-850)	$1629

TRANSMITTER

Freq Range	160 thru 10 meters	
Output Power	SSB, CW, FSK, FM	20 ~ 100 Watts
	AM	10 ~ 40 Watts

```
Modulation                  SSB: Balanced, FM: Reactance,
                       AM: Low level

Spurious radiation          Less than -60dB

Carrier Suppression              More than 40dB

Unwanted Sideband Suppression        More than 40dB

Max FM Deviation            +- 5kHz

Frequency response (-6dB)        400 to 2600 Hz

XIT Variable Range          +- 1.2kHz / 10 Hz step
                       +- 2.4kHz / 20 Hz step

Microphone Impedance             600 ohms

RECEIVER
-------------------------------------------------------------------------

Circuitry              triple conversion

Range                       100kHz - 30 Mhz
                  (author's note: display goes down to 30kHz)

Intermediate frequencies    1st: 73.05MHz, 2nd: 8.33MHz, 3rd: 455kHz

Sensitivity (10db S+N/N):

SSB, CW, FSK  100-500kHz    .5-1.62Mhz    1.62-24.5MHz  24.5-30MHz
         < 0.2 uV  < 4 uV        < 0.2 uV  < 0.13 uV

AM       100-500kHz    .5-1.62Mhz    1.62-24.5MHz  24.5-30MHz
         < 2 uV        < 32 uV       < 2 uV        <  .25 uV

FM (@ 12dB SINAD)                         <  .25 uV

Selectivity:       SSB, CW, FSK  -6dB: 2.4kHz  -60dB: 3.8kHz
              AM       -6dB: 6kHz    -60db: 15kHz
              FM       -6db: 12kHz   -60db: 24kHz

Image Ratio:                More than 80 dB

1st IF rejection            More than 80 dB

Notch Filter attenuation         More than 40 dB
```

```
RIT Variable Range          +- 1.2kHz / 10 Hz step
                       +- 2.4kHz / 20 Hz step

Output                      1.5W @ 8 ohms (10% Distortion)

IMD (advertised)            108dB

In response to yesterday's inquiry about international air mail stamps, they can be bought from the DX Stamp Service run by George Robertson, W2AZX and his wife, Marie from Ontario, New York. Their mail address is:

7661 Roder Parkway, Ontario, N.Y. 14519
Telephone (315) 524-8806

An English air mail stamp is $.95, a French stamp is $1.45, and a German stamp is $1.50 based on their current price list. Each stamp is adequate for one unit of air mail postage to the US.

Its a small business run out of their home, and everything's quite informal. He's only about a 10 minute drive for me (suburban Rochester, NY), so I usually just drop in to get the stamps I need. You could write or call and ask for an order form, but I'd just send them a check and include a slip of paper with your order. If your order is small (under about $10), I'm sure they'd appreciate a self addressed stamped envelope with your order.

>   The fact is that his is not happening and I believe I have pinpointed
>one of the reasons. 47 CFR &97.117 states:"Transmissions to a different
>country, where permitted, shall be made in plain language and shall be
>limited to messages to a technical nature relating to tests, and, to remarks
>of a personal character for which, by reason of their unimportance, recourse
>to the public telecommunications service is not justified." What attraction is
>there for the general public to spend thousands of dollars on an amateur
>radio station just to be able to say "5-9, New York" to a Russian ham ?

Similarly, who wants to be subjected to politics when they're trying to relax for a while with their hobby? If voting rates are any indication, there is very little interest in politics in this country.

However, the people who would take advantage of such a change are usually extremists who can't find any other medium to spread their message (usually hate of some sort). See ARF for further examples.

>How can we accomplish that
>through "remarks of a personal character for which, by reason of their
>unimportance, recourse to the public telecommunications service is not
>justified."?

By learning about other cultures, by learning a foreign language, and most importantly, by letting the rest of the world know that we are not political loonies.

>   In fact, just about all of &97.113 is of questionable value. While it
>is clear that an "amateur" service should be free of business communications
>in the strict sense of communications which facilitate financial gain by
>someone, why should it be prohibited for a radio club to use the amateur
>bands to anounce the next club meeting ? The FCC considers such communications
>to be business communications despite the fact that the beneficiary is a non-
>profit organization. (Ifi you have any doubts regarding the FCC position on
>this, talk to Glenn Baxter, K1MAN, who was cited by the FCC for violating
>this rule by talking ut the Amateur RAdio Peace Corps.)

The difficulty here is verifying that the business being transacted is in fact nonprofit, and legal. For example, you could work out a system with your local drug lord to buy a few baggies whenever you order a "pizza" from him. That is precisely why the FCC takes the strict view in this instance.

Bob...you forgot one thing. The Filter"Wants" to see 3K and 25pf at 10.7Mhz as the source and load. Cancelling the reactance out here will mess up the shape of the pasband.

What is needed are Impedance step up (FET Amp) to the Xtal Filter input, and a FET Source follower at the output.

I've just begun reading rec.ham-radio because I've been toying with the idea of getting involved with it. The articles here are interesting, but I'm having problems digesting all the terms and abbreviations you guys use. A trip to my school's library wasn't very fruitful (though I did find an interesting book called "FCC: The Ups and Downs of Radio-TV Regulation."). I would therefore like to solicit from the net recommendations for, and possible sources of, books or articles that would be good for a beginner. Since this is probably one of the most frequently asked questions here, please send electronic mail and I will summarize the responses for posterity.

And, for some humor, a butchered excerpt of ham-speak (no disrespect to the individual posters them is intended):

>> Can you go from USB to CW without retuning?
>
> Well, like most radios, the BFO FQ is different for CW than USB.
> The TS-850 is no different here. BTW, the psuedo-standard CW offset
> these days is 800 Hz.
>
> There's also a description and drawing of applying +8 to +12 volts
> through an RF choke into the DRIVE OUT line to operate a relay
> inside the 850.

FOR SALE:

Sony ICF-2010 receiver. $200 postage paid.

Here are a few details for those unfamiliar with this receiver:

```
Freq.      AM  150-30000 kHz  (1000 or 100 Hz increments)
           FM  76-108 MHz
           Air 116-136 MHz
```

```
Antennas   Air/FM/SW telescopic antenna
           MW/LW built-in ferrite bar
           jacks for external AM (LW/MW/SW) and Air/FM bands

misc info  Uses PLL synthesizing, has sidebands
           signal strength indicator
           4 turn-on times available
           32 station memory bank
           will control a cassette recorder
           scans bands or memory settings
           analog or digital tuning

Batteries  3 D sized for radio, 2 AA for clock/memory backup

Size       11 3/8 x 6 3/8 x 2 1/8 inches (very portable)

accessor.  AC power adaptor
           Earphone
           SW external long-wire antenna
           2 external antenna connectors
```

For further information call me direct.

In the basenote jl@newt.sbi.com (Jean-Louis Ecochard) writes

>I am interested in replacing a ceramic filter ...
...
>How can I match the impedance of the crystal filter ...

and blombardi@x102c.ess.harris.com (Bob Lombardi 44139) provides a good
solution with a numerical example.

One further generic comment that probably doesn't apply to the original
poster's situation: You may want to pay attention to the impedance presented
to the stage driving whatever matching network and filter you use, at
frequencies removed from the passband of the filter. For example, if the
network is at the output of a mixer and there is a significant signal at, say,
the image frequency, and the input impedance of the network is very high at
said image frequency, the dynamic range of the setup could be compromised.

->Thad   KG5ES

I'll guess that there is no easy mod to a NBFM xcvr, but I could easily
be wrong (the spreading should be easy, but the locking might be
a good trick).

I've no idea on question 2.

I've reposted your entire article because I saw absolutely no followups
(which used the words "spreadspectrum info wanted"), and it seemed to
me that SS should have generated *some* kind of responses!

So, what say the denizens of rec.ham-radio?

There is currently no version of the TCP/IP code available for the Apple IIc. The only access that you would have to the TCP/IP world is to do an ordinary connect to a TCP/IP mbox and use the Telnet functionality of the mbox to make telnet connections of other TCP/IP sites. Since you gain very little by this approach, it's hardly worth the bother. The real advantage of the TCP/IP system is that a part of the network resides *inside* your computer giving you instant access to all the services of the network and guarranteeing uncorrupted data flow end to end between hosts. This is why things like TCP/IP TNCs and NOS-in-a-box are a waste of time. IMHO anyway.

While the CB *operator* is not required to be licensed, he is still subject to The Communications Act of 1934 as ammended and any other rules promulgated by the FCC. While he might be cited for transmitting false and deceptive signals(1934) for using a ham call, the real risk is to the licensee of the amateur radio station whose *station* call is being used. The amateur could be cited for allowing his station to be used out of band, a clear violation of amateur rules. If you are tempted to use an amateur radio station callsign on CB at least have the intelligence to use an obviously foreign callsign. Then the FCC would have to track you down and issue a citation for false signalling rather than opening the callbook and mailing you the citation for out of band operation.

Query about Antenna Design

I will explain the situation before I ask my question.
I currently have (built some years ago) a 6m helically wound dipole.
It consists of two couch springs centre fed and stretched out to obtain
the correct turns/unit length ratio :

```
 approx 1m long ~~~~~~~~~~~~~~~||~~~~~~~~~~~~~~~ <- spring
                                <- feed (with tuning cap)
```

It was designed by extrapolating some rubber-ducky design information, and tuned
up extrodinarily well considering. The ends have an extra variable length
wire bit for tuning.

Since this beam is used for direction finding I would now like to make it into
an array using either a single director, a single reflector or at a squeeze
both.

I propose to build a reflector by making another spring-helical section
with approx 20% more turns (and hence physical length).

My question is: How far from the driven dipole should a "helical"
parasitic element be mounted ? A standard 0.15 to 0.2 wavelength ?
Or less ? The overridding concern is front to back ratio.

Thanks in Advance

```

According to a note in EE Times, due to an insufficiency of military grade
GPS receivers, the military has issued 3000 commercial sets to friendly
forces. The GPS receivers remain in high accuracy mode. Apparently, this
will not give the Iraqis any usable advantages, but will help allied forces
a great deal.

This is the important point. The FCC issues two instruments of authorization on one sheet of paper. One is an operator's license and the other is a station license. It is the station license that is associated with a callsign. The amateur *licensee* is identified by his name and address. A licensee's station is defined, roughly, as transmitting equipment owned or controlled by the licensee. When operating someone else's station, you may identify by your own station callsign if the station has been "loaned" to you and you are in control of it's use. You are restricted to the privileges of your operator's license. Or, you may operate as a "guest operator" using the station's normal callsign. You are still limited to the privileges of *your* operator's license. Or, you may operate as a "third party" using the callsign of the other amateur's station and enjoying all the privileges of *his* license class. You will be subject to third party rules as to what stations you may contact however.

As to "guest" operations, see previous post. As to contest operations and contest credits, see the rules of the applicable contest organization.

In general, contest rules seem as confused about the separation of operator and station licensing as anyone else. Certainly in multi-operator contests the *station* callsign used is credited rather than the station callsigns of any of the operators. In single operator contesting it seems to be *assumed* that the operator is the owner of the station.

Thanks again to all who have responded to my previous requests for information. Here's another question...

Years ago my dad used a telegraph-style key for sending Morse code. He called himself a "brass-pounder" and said he didn't care too much for using the "bug." In what little reading I've done so far, I've gathered that what he called a "bug" is a keyer paddle. I've also run across the term "iambic paddle" here and there, and I think I know what an electronic keyer is. Is there anyone out there who would be willing to explain the relative merits of these various devices, and perhaps clarify the terminology for an aspiring CW'er?

Thanks.

Greetings,

I just picked up a couple of Gates Cyclon 12Volt 2.5AmpHour gel-cell batteries at a ham fest. When I got them home, I found that they do not hold a charge, not even remotely. One will hold approx. 5.9V, the other approx. 4.2V.

These batteries are arranged in 2 packages of 3 cells each. Each of the 3 cell groups has an opening in the top of the center cell with a rubber cap.

I am interesed in using these batteries for a few different projects and would like to revitalize them, if possible.

Thats the question, how can I revitalize these cells? Is adding a little water the way, or maybe some sulfuric acid? I am not a chemist and do not know what is in these cells and I do not want to do something dangerous.

Some additional info: The batteries appear new (i.e. no scratches were present on the tinned spade lugs suggesting nothing had been connected to them). I am charging with a homebrew constant voltage charger I use for another gel-cell I have, and I tried an automobile battery charger, same results with both arrangements.

Please reply directly, or at least to rec.bicycles as I will not have time to browse all three newsgroups.

73's and THANKS!

happy to help you find it Roger, and congrats on passing the elements.

well here it is from page 6-6 of the "The FCC Rule Book" (an ARRL publication)

Q, When my ham friends from the local radio club come to visit my home and
operate my rig, or vise versa, whose call sign is used? What frequency privileges
may they (I) use then?

A. As discussed in the section on control operatiors, you may "lend" your
station to a your friend; he then uses his own call sign to identify his
temporary station.
  Or, you may designate him to be the control operator of your station.
He signs your call sign and operates within the privileges of your license
to the extent that his license permits [my comment: the lesser of two privlages]
; if he has greater privileges than you, he can use them by signing your
call followed by his. For example if Rosalie, WA1STO, an Advanced, visits
the shack of Kirk, NT0Z, an extra, Rosalie signs Kirk's call, but must stay
within her Advanced privileges. On the other side of the coin, if Kirk visits
Rosalie's shack [???shacking-up???], and is using his Extra class privileges,
Kirk must add his own call to the end of the station ID: WA1STO/NT0Z.

Hope that clears things up.

Well, I will throw in my $.02, but caveat here is that I am not even a barracks
barrister, so, like most free advice, its worth what you paid...

You have a station licence, and an operator's licence... (yes, same piece of
paper) so, when someone operates your station, they use your call "operated
by "their call... So, I think you will find it legal to work your home call
while on dxpedition (and I and a few others have done so).

More interesting perhaps is the awards part of the question, because, after all
that is why there is fuss to work these gents, right?

My experience with the ARRL (and no, I don't want a flame war, but...) is
that they count the station NOT the operator for the award. I have had trouble
in the past getting cards/awards that spanned a call-sign change because of
this. I do not know if it is still their current policy, but it seems like if
Joe works you on DXpedition to ZA, you and he could both get cards...
one for the station and one for the operator???

Now that we got that rubberband really wound up, I will let it go, and see
whose hair is caught in it, right?

Flames optional.

>when dfing to assume nothing and use a bidirectional antenna from 2 or 3
>locations (far away locations) and allow the intersection of the reports
>given by these stations determine the location of the xmitter.

When I wrote that, I was "looking" at my bearing indicator as I "rotated" my dipole. You are right, of course, in pointing to the great circle bearing. Note that there are two intersections of the three great circle paths, on exact opposite sides of the earth. One cannot use intersections as the assumed position unless the DF'ing systems are perfect (and that includes a zero-degree-wide null).

I'm surprised that you missed my math error. :)
The transmitter can be anywhere on a 500-mile arc, not a 300-mile arc as I posted. Now, use three stations at 120-degree increments around the hypothetical exact location of the transmitter (the best case for a three-LOP fix). Give each a 10-degree-wide null. The resulting "fix" can be anywhere inside a triangle with 500-mile-long sides. One might be able to find Texas with such a fix, but I doubt that you'd do much good at locating the transmitter. The best you could do would be to make an "assumed" position at the exact center of the triangle, then "fan out" from there. If we can get

the null width down to about half a degree, then we would reduce our triangle of assumed positions to about 25 miles on a side. We could "pinpoint" Dallas with our three ideally-located RDF stations.

I don't know if affordable equipment exists that can give that sort of accuracy today. In addition to null-width, the accuracy of the fix depends on plotting the *exact* location of the RDF stations as well as the accuracy of the RDF station's bearing readout equipment.

Accumulated errors in the RDF bearing reach a maximum at 90 degrees at the RDF station and on the exact opposite side of the globe. If the target transmitter just happens to be at either of these locations, then these errors don't matter. Otherwise they get significant, and antenna pattern directionality (or lack thereof) is probably the greatest contributor.

|> The last word I heard was that accuracy had actually improved, because the
|> US military forces in the Gulf are making extensive use of commercial
|> Navstar receivers, while the Iraqis have little or no Navstar equipment,
|> so the public-access code is being kept as undegraded as possible.

A little deeper information: all the new GPS/Navstar satellites (so-called

"Block II") have what is called SA, Selective Availability. SA allows the DoD to dither the effective phase and frequency in the pseudocode that contains the range information. I forget, but I think they are also allowed to lie a little about their orbits. Anyway, they can then add uncertainty in several places. Starting in April or so of last year, they turned on SA on the Block II satellites, but only part way: they just added about 100 ns pure white phase noise. So, if you had time to track for a while (say, if you are NIST and want to transfer atomic time accurately) you could get around this. The SA limits triangulation accuracy for positioning to about 100 meters, compared to 10 m or so with SA off. Note the few older Block I satellites still in operation have no SA capability; if you can control which satellite you talk to, you can get around it (until they launch enough new ones to retire the old ones).

In August, when Desert Shield started, the DoD realized they needed Navstar stuff, but their military versions of the receivers are not yet ready, so they switched SA off. As Henry stated, this is little strategic loss, with much to gain (the commercial Navstar receivers are portable enough for infantry). If anything, I'd imagine the Iraqis may have some GLONASS equipment from the Soviets, if they trusted them enough. GLONASS is just as good as GPS (but I think the receivers are a little less portable).

Maybe because Kenwood and Icom put audio amplifiers in their
radios, while Yaesu doesn't seem to think it's necessary. Take
the 470 and any Kenwood or Icom outside the store to the street
where there's some (audio) traffic noise. Tell me which radio
you can hear.

I picked up a book when I was in London last, titled Handbook for Radio Operators, put out by British Telecom International, and published by Lloyd's of London Press.
It has the standard phonetic alphabet, and these phonetic digits:

	code word	spoken as*
0	nadazero	nah-dah-zay-roh
1	unaone	oo-nah-wun
2	bissotwo	bees-soh-too
3	terrathree	tay-ra-tree#
4	kartefour	kar-tay-fower
5	pantafive	pan-tah-five
6	soxisix	sok-see-six
7	setteseven	say-tay-seven
8	oktoeight	ok-toh-ait
9	novenine	no-vay-niner
decimal point	decimal	day-see-mal

* Each syllable should be equally emphasised
#The book has tree, not three

As a result of numerous enquiries sent to me after my earlier bulletin, here are some more frequencies worth giving a listen to bearing in mind the current political climate. All times given in GMT. Note that due to propagation conditions and/or military action, some of the stations listed here may not be keeping to their published schedule.

```
----------------------------------------------------------------------
+  The following information was compiled in part from the bulletins +
+ sent out by G6WXU & G4SZX, to whom acknowledgement is hereby given +
----------------------------------------------------------------------
```

Short Wave Broadcast Stations in Frequency Order

Frequency	Station	Comment
6040	Voice of America	After 1800z
6045	BBC World Service	
6055	Radio Baghdad	
7325	BBC World Service	
7465	Israel Radio External Service	2230z
9022	Voice of Islamic Republic of Iran	
9410	BBC World Service	
9435	Israel Radio External Service	2230z
9475	Radio Cairo	
9560	Radio Jordan	1420-1730z
9675	Radio Cairo	
9705	Saudi Arabia	1600-2100z
9720	Saudi Arabia	1600-2100z
9900	Radio Cairo	2215-2245z
9950	Radio Damascus Syria	2005-2105z
11585	Israel Radio External Service	1100z & 1815z
11605	Israel Radio External Service / Radio Jerusalem	2230z
11650	Israel Radio External Service	
11655	Israel Radio External Service	
11765	Israel Radio External Service	1815z
11795	Radio Dubai	
11830	Radio Baghdad	
11860	Radio Baghdad	1100-1400z
11980	Radio Moscow	
12075	Israel Radio External Service	
12085	Radio Damascus Syria	2110-2210z
12095	BBC World Service	
13605	Voice of United Arab Emirates	
13610	Radio Kuwait	
13655	Radio Jordan	1200-1415z
13660	Radio Baghdad	2100-2300z
13675	Voice of United Arab Emirates	
15085	Radio Teheran	
15095	Radio Damascus Syria	
15400	Voice of United Arab Emirates	
15410	Voice of America	
15435	Voice of United Arab Emirates	
15505	Radio Baghdad	1700-1900z
15580	Voice of America	2030z
15640	Israel Radio External Service	

15650	Voice of Greece	
17575	Israel Radio External Service	1100z
21605	Voice of United Arab Emirates	
21675	Radio Baghdad	2100-2300z
21790	Israel Radio External Service	1100z

All times given in Greenwich Mean time, frequencies in KHz.
I can recommend the Israel radio broadcasts and the BBC World Service
as being definitely worth a listen.

Actually you can find lots of sex on the 10 meter CW band. I was chatting away
with an east coast friend on 28.005 on CW when we got blown off by a big USB
signal off to the side. We both started listening to a female voice
shouting into a power mike about how she had some and it was the best we'd ever
find and we had better come on back if we wanted some. Well, my buddy who has
a sick sense of humor warped by many years of living alone in a shack in NH
started coming back to her in CW with some suggestions about what he'd like
to see right about now after three months of New Hampshire winter in the sticks

She started describing some very interesting acts that she would perform for the right change and insisted that someone should "come on back" with a proper offer. Well, my CW buddy had a few ideas of his own and proceeded to describe in detail what you can do with a bunch of wet towels laid over a hot wood stove. Right about this time I was laughing so hard my wife ran in the shack and shouted into my headphones, "What are you laughing about?". "What's the matter with you?". You're frightening everyone in the house!". So I told her what was going on and she looked at me real hard and said, "So this is what you do with all this time you spend out here. A grown man. You should be ashamed of yourself!".

I'm afraid it's going to be a long time before I can convince the XYL that what I do out here really is a public service. It really is. Isn't it?

I thought this was common knowledge. I haven't been paying too much attention, cuz I've had other more important things to do, but this is a subject discussed on our 2 meter repeater quite often, and I know K1YOW has talked with U2MIR, and I believe WA1RHP has also. It's also not just packet....sometimes he's on voice, on the same frequency, per K1YOW and KA1ULT, two people who've been watching this closely.

I haven't seen anyone mention it here, but according to "Passport to World Radio - 1991", Drake is supposed to come out with a new general coverage receiver mid year. It has at least a few nice whistles, like a synchronous detector.

-Anybody else hear/work MIR on packet?I thought it was not supposed to be until
-sometime in February. Well good luck and happy MIR chasing.

I got hung up on by MIR on 01/22/91 22:00Z. The BBS was sending out huge
numbers of disconnect requests, and I got hung up on with the best of them.
I was running 5 Watts into a quarterwave in the attic. I heard it again on
01/23/91 23:34, and at 01:10Z.

PS - Please listen before you blast packets!!! I'm pretty sure that U2MIR
is still doing simplex phone QSO's when not running packet. If you don't
hear U2MIR sending CQ packets, please don't try to connect! There is a local
guy (nameless) who is doing this, and it prevents anyone from having a phone
QSO. I realize most hams do this automatically, but it doesn't hurt to remind
those who don't.

stuff deleted...

Why build one from scratch? You can buy a WWII flux-gate compass from
a company called JOLLYCO (or something like that) out of Chicago.  These
are the real thing, minus electronics, for somewhere around $35.

If you're interested, I can dig up / verify the company name & phone number.

See December 1988 _Radio Electronics_ "Hardware Hacker" column, where Don Lancaster discusses fluxgate theory and includes some circuits.

The November 1989 issue of _Radio Electronics_ magazine has an article on how to tap two voltages from the Radio Shack Electronic Car Compass to provide heading information for a computer. This compass costs about $50.

Larry Lippman writes:
>For further information on flux gate devices, you might wish
>to try a flux gate manufacturer, such as Humphrey, Inc. or Sperry
>Navigation Systems.

For about $300 you can get a gimballed, damped fluxgate with RS232 output (NEMA standard) from a marine supply house such as West Marine. [This paragraph saved from previous discussion; I don't know a brand name.]

What we do is use an attenuator. Not real elegant, but failsafe. I think
some rigs have a low level output for use with transverters.

>
>ii) It's a nuisance not being able to operate 144MHz and HF simultaneously. Why

Moonbounce and UHF DXing/contesting is a whole different game than
local packet. I would use a separate rig for packet.

> Also, you can't operate some of the satellites that use VHF/UHF uplinks
>and 28MHz downlinks.

If you want full duplex, then you need a second receiver, but that is also
true if you are using a UHF allmode.

With my hand shaking, I nervously wrote out the check... $1629.00 plus
tax. I'm not one who can afford to make a $1600 mistake and if it
weren't for my trade in allowance I wouldn't have done it at all. Now
that I've owned it for all of 1 day, I'm so excited that I can hardly

wait to write about it.

Im talking about the new Kenwood TS-850S. Yesterday, I traded in my old reliable TS-440 (sniff) and took the plunge. For the past several months, I'd been eyeing the TS-950SD but could not for the life of me see paying ~$3500+ for the thing. Worse yet, I'd heard some mixed reviews about it which weren't all that great.

Last Monday I stopped in to the local candy store and lo and behold there it was - the TS-850. I'd seen it in the magazines for about 2 months now and it had just arrived. Although I had previously discounted it in my mind as a lesser radio (compared to the 950), I sat down to it anyway to see what it had to offer. Within about 20 minutes I was hooked and had made the decision to buy.

After reading most of the manuals (yes, there's more than 1) and playing around with it for an evening, I have the following to report:

FEATURES:

Here's what the basic rig has built in (in no particular order):

- Band stacking
  I really wanted this on the 440. Although there's not a separate button for each band, when you use the UP/DOWN buttons to change bands the computer remembers your last used FREQ/FILTER/MODE for that band.

- Serial computer interface (TTL).
  This has been an option on most all of the previous Kenwood rigs. Now, all you need is a simple level translator (1488/1489) to run this on RS-232).

- PL tone encode
  Again, what was once an option is now standard. Can't say that I'm that interested in 10m repeaters but it's nice anyway. The PL mode is adjustable for Burst or Continuous.

- Electronic keyer with adjustable weight
  This will likely become standard on all future rigs in the mid to high price range. Haven't tried mine yet since I just had built the QST CMOS Super Keyer II (sigh).

- Auto CW keyer weight adjust according to speed
  This adjustable feature apparently does a weight adjustment for you as the speed increases. It can be disabled. The adjustment can be set to increase or decrease the dash length with increases in speed.

- 105 memories plus band memory for each band
  100 main memory channels in the typical Kenwood fashion. Channels 90-99 are special function for split and for programmed scan band limit. 5 more "Quick" memory channels

(see below).

- 5 position FIFO scratch pad memory

This is really neat. There's a couple of little buttons right next to the VFO knob labeled "Quick Memory" MI and MR. Pressing MI puts the current VFO/filter/mode selection into the top of the scratchpad stack. When another frequency of interest is found, you press MI again and what was in #1 is pushed down to #2, the new frequency becomes #1 and #5 falls off the end of the stack. This is completely independent of the regular 100 memory channels.

- All mode output power level control

The PWR control controls output power independent of the current mode selected. You still have your CW Carrier level and MIC gain controls as well.

- Automatic Tuner with band memory

A big improvement over the TS-440 auto tuner, and even better than that in the 950. There's the same Auto/Thru switch and a AT TUNE switch. The nice thing about this one is that when you press AT TUNE, the rig tunes up and releases (it's a momentary button). In the older rigs, you had to release the AT TUNE button yourself. As you change bands, the auto tuner automatically switches to pre-programmed positions so that when you do hit the AT TUNE switch the tuner is almost ready to go - thus shortening tuning time.

- Manual auto tuner override

This is quite interesting. By setting one of the options on in setup mode, you can indicate that you prefer to operate the internal tuner manually. To do this, you watch the SWR meter and turn the VFO and the MCH/VFO knobs for best indication.

- Digital CW pitch control 400 - 1000 hz

Another nice feature. The digital selection is made in steps of 50hz from 400 to 1000 hz. Changes both tone and transmit offset.

- Fine tuning button

I don't know how I ever lived without this one. By pressing one button, the resolution of the VFO knob is divided by 10 allowing for very smooth fine tuning adjustments. Should be very good for RTTY and also very helpful for SSB transmissions.

- Tune switch to zero beat a received CW signal

This button is used for tuning a linear as well as zero beating incoming signals for CW.

- Memory scan, programmed band scan, adjustable scan speed

The scan speed control is a nice touch. While scanning, you turn the RIT control to speed up or slow down the scan. Scan rate is adjustable (in VFO mode) from between 700hz/sec to

20hz/sec. There's also an auto-resume mode which will allow you to twiddle the VFO knob a bit and then after a period of inactivity it will resume scanning.

- All memories store filter and mode selection with frequencies

This is getting to be a bit more typical in the newer rigs but coming from a TS-440 I'm still impressed with it.

- Reverse function for LSB CW and USB FSK

This is truly unique and I've not seen it elsewhere. By hitting the REV button you can switch sidebands on CW and FSK. Probably most useful for FSK.

- SSB slope tune (no more IF shift control)

Although this has been out a while, I can already tell that I like it better than the TS-440's IF SHIFT function.

- M CH/VFO knob for fast band excursions

This little knob, just to the right of the VFO, is an optically encoded shaft which is used for all sorts of things. Normally, it is used to either scroll through the memory channels or to traverse the band in 10khz steps. Takes no time at all to move up or down hundreds of kilohertz. The main VFO does not appear to change excursion rate with knob speed as the 440/940 did. Incidently, unused memory channels don't show up when you're scrolling through memory.

- 2 Adjustable noise blankers

There's a fast blanker for ignition type noise and a wide blanker for woodpecker noise. The width of the wide blanker is adjustable with a front panel knob.

- Adjustable speech processor

Sure, these have been around for years, but not on the TS-440 which only had a PROC ON/OFF switch. It's nice to have control back.

- Monitor function with separate level control

I also missed this on the 440 although Kenwood has been offering it for years on the other rigs. Glad to see it return.

- 32 adjustable function setup procedure

Say goodbye to dip switches and clipped diodes. We now have a smart user interface that allows you to set some of the CMOS RAM operating parameters. The only drawback that I can see is that the setup procedure can only be invoked at power-up time by holding the USB/LSB switch.

- Lock out function

Completely disables transmit. Turn the rig into a receiver to prevent unauthorized usage.

- Adjustable FSK shift

This is nice too. You can select from 170 to 850 hz shift in
4 or 5 steps.

- Adjustable RIT/XIT range
This can be set to +- 1.4khz or 2.8khz in 10 or 20hz steps.

- Display dim control
A single button on the front panel - bright or dim. Bright
does not seem as bright as the 440 however. Regardless,
there's no trouble reading anything.

- IF output for band scope
The 440 did not have this either. Now you can have direct
access to the 8.33 Mhz IF.

- 2 850's can be connected in master/slave arrangement
By connecting 2 850's together via their serial ports, one can
dump it's contents into the other. I'm not quite sure yet what
this will buy you. It's probably cheaper, however, and more
flexible than buying a TS-950 with it's crippled dual receive
function.

- Display can indicate transverter frequencies (144/220/450)
This will be very nice, as soon as the transverters are
available.

- DVR (option) stores cw and voice messages (3)
I didn't buy the DVR but am thinking about it. There are 3 record
and play buttons on the front panel for operating it.

- Remote control input
By building a small box with resistors and switches in it, you
can plug it into the back through a single 3.5mm plug to
control 11 different functions (DVR, VOICE, Quick Memory,
etc.). The input resistance on the 3.5mm jack is sent to an
internal A/D converter, sampled and decoded into a function.

- 13 pin DIN and 6 Pin DIN interface connectors supplied
I had to buy one of those @#$# 13 pin DIN's for the 440. The
plug was hard to get and expensive. Now it comes with
the radio - finally.

- Comes with separate remote programming manual
A nice manual covering all of the functions available on the
serial control port.

- 3 speed AGC control
Fast, Medium, Slow and Off. Again, big improvement over the
440 which only had Fast and Slow. When AGC is off, however, the
S-Meter ceases to function. Although normal, I found was this
confusing at first.

- Peak reading multifuntion digital meter (as with TS-950)

I like the new metering. Some of the old timers who are bad-mouthing the 950 say that they would rather have an old analog meter. The peak hold amounts to a single bar element which stays on for a second or two after the last highest excursion. Nice for figuring RST reports when conditions are fluctuating.

- Dual cascaded selectable IF filters (as with TS-950)
Filtering is very good with this arrangement and I plopped down the extra $200 to get the pair of 500hz filters (I work a lot of much damned CW mode).

- Auto mode shift (USB/LSB) according to frequency
Nice and it's about time.

- Linear amp relay enable switch on back panel
The 950 has this too. On the 440 you had to open up the radio and install a jumper to enable the linear amp TR relay. The problem was that the relay makes a lot of noise which I don't care for when operating QSK CW (oops! I said the C-word again :-). The switch allows you to disable the clatter when you're not running QRO.

- Many more I/O connectors on the back panel
Lot's more - many relating to the external DSP box which I haven't seen yet. Don't know that I'll put $500 down for one yet, I'll have to see some proof of it's worth first.

- It comes with a microphone (same mic as the 440).
Many of the base-style rigs don't come with a Mic. The dividing line seems to be power supply. If the rig runs of 110, it doesn't come with a mic.

- Enhanced split frequency operation
You can split between: VFO-A/VFO-B, VFO-B/MEM, VFO-A/MEM in any combination of transmit/receive.

+ more that I can't think of right now...

OTHER IMPRESSIONS

The salesman at the candy store said that Kenwood had underpriced this radio. I tend to agree since it's only $400 above the price of the TS-440. The TS-440 has been the best selling rig of all time but I do believe that its days are now numbered. Also, there are some non-overlapping features between the 950 and the 850 to the point where I really think that 950 sales will suffer. Unless you really-really think that the sub-receiver is worth it, and that the extra 50 Watts is needed, then I can't really think of a reason to buy a 950. I'm sure there are some, but not for me.

Also note that the 850 operates on 12 Volts!. The companion PS-52 power supply (not included in the $1629 price) is wimpy. It's rated at only 16A continuous. I opted to keep my Astron 35. The companion speaker, the SP-31 is ugly. It does not have a wire-mesh grille and you can see the speaker cone when looking at its front. It does have a couple of passive filters but it did not sound appreciably different than the built-in speaker - again, I passed on it.

The optional 500hz filters seem to be of a much higher quality than those I had in the 440. With the 440 where was noticable insertion loss of about 2 to 3 s-units. Not so in this rig and about all I see is 1/2 to 1 s-unit penalty for filtering.

The construction of the radio is almost all SMD (surface mount devices). I only took the bottom cover off to install the filters but inside I saw no leaded components. The boards were profusely lettered which should help in troubleshooting. Some of the potentiometers were only about 1/8" square!.

My general impression is that I'm operating a computer that looks and acts like a radio. This is more evident in this rig than any other I've seen. Learning the various commands, however, was not at all difficult (although I'll concede I'm a computer person), and I believe that the user interface is very well done. The Quick Memory, for example, was impossible to decipher until I had read the manual (RTFM!). After reading it, however, I had no trouble at all.

CONCLUSION

Well, this article has gone on about long enough as I've spent about as much time writing about it as I have using it. I'll post any updates or new info as I become aware of them. As you can probably tell, my initial reaction has been positive :-).

Subj: What do you want in a rig? (was "ricebox")

Gary, KE4VZ, has mentioned a lot of stuff about what makes Japanese rigs
stand out against American products. I agree with almost all he had to
say about the subject in general: what the user wants. As for such
names asn Motorola, et al, one must keep in mind that they are *not* in

the consumer electronics business with their radios, or I'm absolutely certain that their marketing department would have a pretty good handle on what the *consumer* wanted. Then again, Hams are not the "consumer" market that marketing departments usually think about when they talk about "consumer electronics". They are a very narrow niche market which few are willing to invest in. What Hams usually see, IMHO, is spinoffs from other equipment that the company may be making for military or commercial markets.

What do *you* want in a rig? Everyone has his own set of requirements for functionality; and everyone has his own idea of what constitutes "quality" in a product. For instance, for me a "quality" product must have these:
1. 100-200 watts out on 160-10 meters.
2. Will load into a dead short or open circuit for a reasonably short time without blowing up.
3. Rock-solid stability under all operating conditions, and low or no long-term drift.
4. Knobs and controls easy to manipulate and don't fall off, slip, and not jammed together like sardines.
5. Frequency readout that is easily readable, and can be depended upon to be accurate day after day after day.
6. Easy to maintain. After all, no piece of equipment will last forever; and if it needs fixing, I don't want to have to take it to a brain surgeon.
7. Receive sensitivity and selectivity such that I can copy everyone who can copy me without being wiped out by the Ham down the street operating 100 kHz away.

Requirements 2 through 7 apply to rigs for any band above 10M. Notice that I didn't include memory capability. To me, that's just unnecessary expense for bells and whistles which contribute little to the performance of the radio. If you are going to build a radio for me, you can put that hundred dollars into triple- or quadruple- saftey factor components that will last longer, and a heavy copper-plated chassis with lots of shielding. Or in more expensive finals that will loaf along at rated output. I don't attach much importance to miniaturization, so you can make mine a mite large; certainly not any smaller than, say, an FT-101.

That's *my* requirements. As Phil says, "your mileage may differ". How's a prospective manufacturer to know? Well, if I were in the marketing department of a mfgr who made Ham gear, I'd ask. And ask, and ask, and ask; just as Gary said. When I got a lot of answers, I'd try to make a product (or, more likely, several products) that met what the majority of Hams said they wanted.

73,
Dube   N5PDK

Has anyone noticed a degradation of the Navstar GPS system since the
outbreak of unpleasentness in the middle east?

The implication, when GPS was first started, was that during times of
crisis the C/A code would be degraded so that an enemy could not use it.

Does differential GPS totally get around this, or is there a trick
they can use to defeat this technique?

>   Would you mind a CBer using *your* callsign?  This could be fun, can I be
> 9N1MM?   Can you identify using the call of a commercial radio station too?

A ham call sign identifies the station, not the operator.  A CB "handle"
identifies the operator, not the station.   So if you use a ham call as
a CB handle it's important to make sure that no reasonable person could
```

mistake it for a station ID. Otherwise it's a deceptive radio signal or
it's operation out of band. Either way it's grounds for having the ham
station license pulled if the signal is sent with the knowledge and
consent of the station licensee.
In short using a ham call this way is needlessly risky.
Why not use (for example) "Derek" as a CB handle ?

I believe the part numbers for Anderson Power Products parts are
as follows:

contact: CAT. 1330 POWFRPOLF 30AMP CONTACT #12 QTY 1
contact: CAT. 1331 POWFRPOLF 30AMP CONTACT #12 QTY 100

red body:CAT.1327 POWERPOLE 30AMG HSG/SPG RED QTY. 100
black body: ?

The address of the company from the box is as follows:
Anderson Power Products,
Division of High Voltage Engineering
145 Newton Street
Boston, Massachusetts
02135

To connect two cables you would need 4 contacts, 2 black bodies, and 2 red bodies. The bodies are grooved on the sides so they can be locked together into a single plug. A screw can be used to pernamently lock a black and red body together but so far the connectors stay together all by themselves because the cable they are attached to prevents them from slipping apart. For cable I use the dual conducter cable that is used on boats. It is made in various gauges. One side is red and the other is black. I split the cable down the center as far from one end as is necessary to attach the connectors. A short length of heat shrink tubing is used to prevent the split from traveling further down the cable.

I do not know why this connector was chosen over others. The most apparent advantages are that there is no gender problem and it is intuitively obvious which contact is plus, i.e. the red one. Since this connector is being used state wide, anything which reduces the chance that one department, county, or service district would do something backwards from everyone else is eliminated. Some of these entities are more than than 500 miles from each other.

I am seriously interested in buying this radio right now. I have heard it is very good and is very promising.. If you find any other information about this radio, could you please send it to me at johnr@twiki.pdx.com.

Thankyou
John Rosenbaum

So, the upshot seems to be that the "numbers stations" can be located (at least some of them) and that they are not-so-secretly identifiable with various intelligence agencies.

But they aren't frequency-coordinated or sanctioned by anybody, at least, not under ITU or Federal regulations. Technically, that would mean that no one could be nailed for interfering with them under FCC regulations, at least, in terms of interference with another assigned service.
Of course, they run about a megawatt so attempted interference would be futile. And they don't seem to be commonly jammed, either, which has to be curious. Perhaps potential jammers find more benefit in copying the numbers and trying code-breaking.

The point is that these transmissions aren't "legit" under the federal and international frequency regulations. I have heard it rumored that other federal services tend to wander all over the bands as well, because they are at the same level as the FCC and hence immune from regulation.
Co-ordination yes, regulation no. I'd be interested in knowing the legalities of this.

Subject: old WW2 aircraft electronics manuals
Message-ID: <38451@cup.portal.com>
Date: 25 Jan 91 06:25:28 GMT
Organization: The Portal System (TM)
Lines: 30

I have some WW2 manuals for military electronics equipment available free if you pick them up at my house or for a small fee if you want them by mail. Priority goes to people who have the actual equipment described by these manuals.

AN/ARN-8	Marker Beacon Receiver
RAK-7	Radio Receiver
AM-40/AIC	Interphone Amplifier
AN/ARC-1	Aircraft Radio Equipment
AN/ARC-2	Aircraft Radio Equipment
ZB-3	Aircraft Radio Homing Adapter Equipment
LM-15	Crystal Calibrated Frequency Indicating Equipment
AN/APN-4	Radio Set

I intend to keep the following manuals, but would consider parting with them to a sufficiently interested party.

TS-45/AP	Radar Test Set
TS-146/UP	Radar Test Set
TS-147/UP	Radar Test Set
TS-148/UP	Radar Spectrum Analyzer

I'd be interested in what installations had the AN/APS-4, AN/APS-6A, and AN/APS-15 radars. These are some of the radars mentioned in these manuals. I know AN/APS-15 was used in B-17 bombers, because there's pictures of TS-146/UP being used both inside and outside the bomber. I'd like to know what theaters and during what time span these radars were used.

I'd also like to know if there were microwave spectrum analyzers which
are older than the TS-148/UP, either military or civilian.

You know, this brings up an interesting subject. Do hams have less sex
that other people? If this is true, then it explains a lot about the
hobby. Perhaps the ragging on the ARRL and Radio Shack is simply
misplaced sexual tension. Maybe the new no-code thing violates a
deep-seeded need to have some sort of passage into manhood. Are huge
vertical antennas really phallic symbols? I do notice that a lot of
hams seem to have interesting ideas about antennas, you know: "mine's
bigger, so it's better", "yeah, my vertical is smaller, but it packs more
power into a small size", "my vertical gets out further", "I get better
reports from my vertical", etc.   Just what is a ham saying when he talks
about a "full quarter-wave with radials?" I'm sure if Freud had been a ham,
he would have written extensively on the subject.

The big question is does ham radio CAUSE a lack of aforementioned physical
activity. Well, I'm a ham, and I haven't so much as had even one
date in months. Of course, I think this is because I've spent my
Saturday nights lately building all those different versions of twin-lead
jpoles that have been posted on the net.   I don't know why .... I already
have a 2m antenna that works just fine ... I feel that it somehow is a
deep calling from within me.

Perhaps if I were to give up jpole building, stay away from Radio
Shack, and build a 40m vertical that I would see significant improvement
in my love life. Maybe if QST had an annual swimsuit issue like Sports
Illustrated, people would like the ARRL more. Then again, maybe such
questions are better suited to psych.ham-radio or rec.sex-never-received.

POTENTIAL MAJOR FLARE WARNING

ATTENTION ATTENTION

/\

January 25, 1991

ATTENTION:

A significant surge of solar activity has begun. Two very significant and very large active regions have developed and are now capable of spawning major energetic flare activity. In addition, significant activity has been observed on the eastern limb. Loops and an associated flare was observed near S14E90 today. The solar flux has exploded to a value of 244 and is expected to rise perhaps in excess of 260 by the time the peak is reached. The sunspot number has likewise experienced a dramatic increase and is now reported at a value of 216 (although it will likely climb quite higher as the eastern limb region(s) rotate into view).

This warning presently applies to Regions 6462 (S15E32) and Region 6466 (S09E37). THESE REGIONS ARE CAPABLE OF SPAWNING VERY STRONG MAJOR FLARES ANYTIME OVER THE NEXT 3 TO 7 DAYS! PROTON FLARING IS A STRONG POSSIBILITY FROM THESE REGIONS.

Region 6462 has an FKI optical configuration and now sports a potent Beta-Gamma magnetic configuration. Magnetic gradients in this region are HIGH. It covers an area of 3,780 million square kilometers and encompasses a total of 59 sunspots. It has an angular extent of 18 degrees. MAJOR FLARING FROM THIS REGION MAY BE IMMINENT!

Region 6466 also contains an FKI optical configuration and contains a strong Beta-Delta configuration. Magnetic gradients in this region are also HIGH. This region contains 42 sunspots within an area of 2,970 million square kilometers. It has an angular extent of 17 degrees. MAJOR FLARING FROM THIS REGION IS ALSO IMMINENT!

At 03:18 UT on 24 January, a long-duration class M3.2/SN flare was generated jointly by Regions 6462 and 6466. The duration of this flare was an enormous 173 minutes (2 hours, 53 minutes)! It was accompanied by significant radio bursts as well as Type II and Type IV sweep frequency events. The flare location was at S19E42 and was associated with a strong 5,800 s.f.u. (solar flux unit) radio burst at 245 MHz. It produced a SID/SWF between 03:18 UT and 06:11 UT, affecting frequencies up to 13 MHz. This flare WILL produce a terrestrial impact with the earth (see below).

The Space Environment Services Center has issued a condition YELLOW alert status for potential PCA activity. Translated, this means that if a major flare occurs in either Region 6462, or 6466, the probability that the flare will eject energetic protons capable of producing potentially significant PCA activity, is very high.

MAJOR ENERGETIC FLARING WILL BE POSSIBLE FROM REGIONS 6462 AND/OR 6466 FOR AT LEAST THE NEXT 3 TO 7 DAYS (possibly longer). WATCH FOR IMPENDING MAJOR FLARE ALERTS.

RECENT MINOR FLARE TERRESTRIAL IMPACT FORECAST

The class M3.2/SN long-duration event which was accompanied by Type II and a moderate Type IV sweep frequency events is expected to produce a terrestrial impact. The accompanying shock is expected to reach the earth late on 26 January through 27 January. Geomagnetic activity is expected to reach minor to major storm levels over high latitudes, but should be mostly active to very active over middle and low latitudes. There is a risk of minor storming over middle latitudes.

An auroral storm may materialize over high latitudes on 26/27 January in response to the enhanced corpuscular radiation from this long duration flare. The auroral activity will be moderate with possible periods of high activity over high latitudes. Activity over middle latitudes should remain confined to mostly moderate levels, but some localized area's of high auroral activity may become visible over middle latitudes (particularly the northerly middle latitudes).

HF propagation conditions will become markedly degraded late on 26 January through 27 January. Moderate to high levels of distortion, noise, fading and flutter could be experienced, if activity reaches or surpasses the levels currently predicted. High latitudes will likely experience very poor radio propagation conditions late on 26 January through to 28 January.

VHF signals could experience some interesting phenomenon on 26/27 January, particularly over the northerly middle and high latitudes. There is a substantial possibility for auroral backscatter communications on VHF frequencies (6 meters to 2 meters) late in the day on 26 January and into 27 January. The best periods to attempt backscatter communications will be near sunset and near midnight (+/- a few hours). VHF signals will likely become degraded late on 26 January through 27 January as intense ionospheric ionization forms near and in the auroral zone during these potentially stormy days.

Active geophysical conditions and degraded radio conditions are expected to persist until about 28 January (barring any significant solar outbursts, which seem quite likely at the present time). It should be noted that the start-time of the degraded conditions may not occur until sometime on 27 January. However, models indicate the shock velocity should be high enough to impact with the earth late on 26 January or early on 27 January (UT time).

POTENTIAL MAJOR FLARE WARNING SUMMARY

- MAJOR ENERGETIC FLARING IS POSSIBLE IN TWO ACTIVE SOLAR REGIONS.

- THERE IS A STRONG POSSIBILITY FOR POTENTIALLY INTENSE PCA AND SATELLITE PROTON ACTIVITY FROM MAJOR FLARING (IF IT MATERIALIZES).

- PROTON FLARES ARE VERY POSSIBLE.

- INTENSE SID/SWF EVENTS ARE LIKELY OVER SUNLIT AREAS OF THE EARTH IF MAJOR FLARING OR PROTON FLARING OCCURS.

- TERRESTRIAL IMPACTS COULD BE HIGH IF PROTON FLARING BEGINS ANYTIME WITHIN THE NEXT FOUR TO SIX DAYS.

- PCA ALERT STATUS: CONDITION *YELLOW*.

- HIGH-LATITUDE PCA-INDUCED RADIO BLACKOUT WARNING HAS BEEN ISSUED. RADIO BLACKOUTS OVER HIGH LATITUDES ARE POSSIBLE IF PROTON FLARING OCCURS.

There is a European version.
You can apparently turn the American into the European with a diode mod.

Would someone please send me the dual band j-pole information.
I missed it.
Thanks & 73.

That's what I get for letting my fingers do the thinking for me. When the original question asked about 438 MHz, my fingers assumed that was a limit without even talking to the brain.....   And rec.ham-radio has enough flames whenever anyone asks about out-of-band modifications that I wanted to take extra pains not to give any cause.

My fingers give their public apologies for the mistake. The brain wasn't involved. It proves that license class is not a good judge of how well or often people think.

I recall that some amps are supposedly susceptible to problems of oscillations
when connected to a capacitave load.  I recommend using a choke before the
capacitor to eliminate such problems and help cure the RFI.

Have you ever tried copying code at 100 WPM?
How about sending it with a straight key?

Some people even like to record SSB QSOs in case they miss any information!
Worse heresy has been committed.
If you prefer to copy your code on a slate or on papyrus, that is fine, too.
Probably even better than a stick and sand!

Incidentally, computer generated code is a lot easier to copy since most
peopler have TERRIBLE fists!

No need to reply to this, I can also think of responses
Live and LET LIVE. I doubt that using a computer to receive code is the
FCC's idea of poor operating practice!

73 for now.

Or buy a complete compass from Tandy (Radio Shack) for $Aus 99. Don't know
how good they are though.

Sex is NOT outmoded. Just having a sex proficiency test before issuing a marriage license.

In fact, according to Havana Moon's book "Uno,Dos,Cuatro..A Guide to the Numbers Stations", several of these transmissions, have, over time been tracked to various locations. Some have been tracked to a military installation near Warrentom/Remington, Va. SOme have been tracked to an installation near the Dade County Zoo in Florida. Some have been determined to be eminating from Cuba (*German* numbers no less!).
Most are unknowns, though. HM's book is interesting reading by the way.
It's published by Tiare Publications, ISBN# 0-936653-06-X.

Add KFI 640 Los Angeles to that list.

Is there still such a thing as "clear channel" on the AM BCB?   I thought that the FCC started getting away from that about 10 years ago due to complaints from local daytime-only stations that wanted to operate at night.

This subject was discussed on rec.radio.shortwave last year. As I recall, several gentlemen located a numbers station. The discussion didn't yield any great detail but implied that these stations are operated by intelligence organizations that take security very seriously.

AA7BQ reviewed all the bells and whistles about
a new Kenwood.

Seems he forgot one thing: does it receive and
transmit, the former especially, any better than
the ts430, ts440, ts940? I sure hope it's some
improvement, especially in the built-in phase
noise department. Sure a lot of Kenwoods have
been sold --- the *power* of *advertising* I
guess.

I guess what it comes down to is that some people like to work on their radios. Some people like to work on cars also. I have a friend who has an old Camero; the thing breaks down all the time, but he doesn't mind working on it all weekend.

On the other hand, I just want to jump in, turn the key, and drive. I have no desire to work on my car or my radio. This is why I have a Toyota Celica and an Icom 735. Mind you, I'm not saying that there's anything wrong with working on your own stuff; in fact, I make my own antennas and have also built a QRP 40m rig.   I just want a rig that I can use at home, and then unplug it, so I can use it in my car too. The 735 fits the bill beautifully.

You can't have everything. You can't have a super-compact rig with a lot of features AND have room inside to modify it. You can't have bomb-proof solder connections AND make it easy to modify them.   There is no one radio that will fit the needs of everyone. Therefore, if you want a Ten-Tec/Camero, buy them; if you want a Toyota/Icom, buy that.

I will say this, though: look in Consumer Reports. You will see that the frequency-of-repair records are signifcantly better on Toyotas than on Chevys. In general, Japanese companies are just more serious about quality control. American companies tend to be short-sided, with the attitude of "just get the darn thing out, so we can make a profit this month."   This is why I (and the entire world) tend to buy Japanese.

In article <43047@ut-emx.uucp> oo7@ut-emx.uucp (Derek Wills) writes:
+Several of the stations have been located, and usually turn out to be associ-
+ated with CIA establishments, or are huts in the woods with barbed wire and
+"Keep Out" signs.   People who locate them are told to go away and forget they
+ever saw them.
+
+Or perhaps this was all in alt.folklore.urban (a fun group, by the way)?

Very funny, Derek! I invite you to t-hunt one of these for yourself,
then you tell the rest of us (that have already had the experience!) about
how nice those guards with their M16's treat 'visitors'! ;-) Urban
folklore indeed!

As quoted from <9101251229.AA00018@rtp40.dg.com> by Pete_Simpson@DGC.ceo.dg.com:

```
+---------------
| What with the article on MININEC caveats in this month's QST and
| Bob's book, could we be seeing a refocussing of the ARRL from
| yesterday's technology towards tomorrow's?
| :-)
+---------------
```

I don't know that I'd laugh. I mean, they're actually planning to work on PR, up to and including hiring a PR consulting firm to help! (And about time, too!)

Maybe the ARRL took careful note of who advanced the suggestion that became the new Tech license, and decided that they really *were* slipping.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

Last weekend my system had U2MIR in the axheard list on 144.625, I
didn`t realise what it was until much later. I thought it was just
another local node as TheNET/NETROM nodes have wierd names around here.

John.

If I mail you my copy & a bribe, will you autograph it for me, Bob?
What with the article on MININEC caveats in this month's QST and
Bob's book, could we be seeing a refocussing of the ARRL from
yesterday's technology towards tomorrow's?
:-)

Pete, KA1AXY

I've been working (on and off) on an RFI problem like you describe.
It's a relatively inexpensive "entertainment center" (has a receiver,
amp and 8-track player). Speakers, leads are shielded and bypassed.
No difference. Power cord is filtered. No difference. Only when the
entire box is wrapped in aluminum foil, does the interference lessen.
(BTW, the volume control has no effect on the level of interference,
which suggests the power amp output stages being involved)
My theory is that the power supply leads which connect to the output
amplifier are long and not bypassed. I haven't taken the box apart
yet. There's only so much you can do to these things if they're not
in a metal case...
73,
Pete, KA1AXY

The short answer is no, there are no true clear channel MW stations in
the US. Clear channel protection did indeed go away several years ago.

However, many of the old clear channel stations still cover a large area because few new 50KW licenses have been assigned on those frequencies.

I can still hear WLS, WMAQ, and WBBM from Chicago here in Colorado. However, each of these stations have some other station using the

frequency somewhere in the US, which occasionally interfears, depending on weather.

In these days when half the AM (MW) stations in the US carry the same programming via sattelite (LArry King, Talknet, etc.), clear channels seem less important. I still enjoy listening to distant AM though, and always will!

Sincerely;

NOT! TAUBMAN JASON ROBERT

WM1W raises the great philosophical question: "why bother?" This is a very good question indeed.

First of all, technology has advanced to the point where cw can be done in an automated fashion. Therefore, I need not do cw by hand.

Also, since Buzz brings the issue of sex into the debate, it is only fair to point out that technology now allows for artificial insemination. Therefore, I need not have sex to pro-create. In fact, it is not all too unrealistic to envision computers being involved in this process as WM1W so wisely predicts.

The point being, there are often different means to the same end. The rate of technological growth has increased these possibilities even further. With so many possibilities available, the choice becomes a personal one.

So, the conclusion from this line of thinking is:

why bother? ------> BECAUSE I WANT TO!!!!

Also, "Why bother?" indicates that it is a **bother** to do cw with a computer. I think not. Connecting the TNC to the computer was not much of a bother. Turning the computer and tnc on is not much of a bother either. Personally, I find computer generated cw easier, more enjoyable, and much more precise [C.A.A.I. may be too!!]. The statement also seems to imply that cw done by hand is the only way, or the right way. Again, I think not. It may be your way, or the traditional way, but not the only way.

So, the conclusion from this line of thinking is:

why bother? ------> it's no bother, really!

I am interested in replacing a ceramic filter that has an impedance of 330 Ohms with a crystal filter with an impedance of 3KOhm//25pF. I understand that the crystal filter requires its impedance to be matched perfectly otherwise the ripple gets ugly.
How can I match the impedance of the crystal filter with my circuit ?

can anyone either explain me the theory and give me an example to extrapolate, give me the reference of the magic transformer to order ...

The IF of the crystal filter is 10.7 Mhz.

I've used a bunch of distributors of radio gear over the years and I won't claim to know of the 'best'. But here are a few that have done good by me:

Ross Distributing, Preston Idaho   208-852-0830
[can usually beat any price, will ship based on credit card number and then accept a check to avoid credit card surcharge]

Amateur Electronic Supply Milwaukee, Wisconsin 1-800-558-0411
[not the lowest in price but good selection and a good catalog]

Austin Amateur Supply Austin, Texas (where else?) 1-800-423-2604

Ham Radio Outlet, a million locations.

No warranty expressed or implied. Your mileage may vary. Some restrictions apply.

SpaceNews

MONDAY JANUARY 28, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited distribution.

* U2MIR-1 NEWS *

Packet Radio (AX.25) communications were carried out last week between the Soviet "Mir" space station and many ground stations on 145.550 MHz. Callsigns of U2MIR and U2MIR-1 were used by the amateur radio station on board Mir. Personal observations as well as observations by others seem to confirm the fact that Mir now has a fully operational packet radio bulletin board system, complete with a "standard" PBBS command system capable of supporting mail exchanges between users as well as disseminating news bulletins to all users of the system.

The U2MIR-1 BBS system is compatible with standard 1200 baud 2-meter FM packet stations currently in existance all over the world. No special TNCs or external PSK modems are required for access. Downlink signals from Mir are strong. Even operation with indoor antennas seems possible.

Packet radio operations from Mir came as quite a surprise to many who expected operations to begin in March. While BBS operations took place for several days last week, it remains to be seen when or if operations will continue on a permanent basis. Packet BBS operations from U2MIR can generally be made at any time, since the station can be run in an unattended mode while the cosmonauts are sleeping or busy with other work.

* SPACE RADIATION *

===================

NASA is reporting that operations of the orbiting Hubble Space Telescope are being affected by radiation induced electronic failures on a daily basis. Single event upsets (SEUs) in a 1 kilobit low-power TTL bipolar random access memory (93L-422) are causing Hubble's crucial focusing elements to lose data on a regular basis.

SEU induced errors are being minimized by using a rapid refresh cycle with the RAM device to limit the time in which multiple SEUs can occur. The 93L-422 RAM device has a well documented history of SEU failures, but was used anyway since clever software routines could help correct or prevent SEUs from affecting telescope operations. It appears the SEU problem was greater than anticipated and might also explain why NASA scientists mysteriously lost radio contact with the Magellan Venus spacecraft for 18 hours shortly after insertion motor separation last fall. Scientists are now trying to duplicate that problem in an effort to determine its cause.

All OSCAR satellites experience problems with radiation induced RAM errors. High energy radiation particles damaged one of the sense amplifiers in the Integrated Housekeeping Unit (IHU) on board OSCAR-10. Since that damage occurred, the spacecraft essentially became "brain dead", and no longer transmits RTTY and CW telemetry or supports a sophisticated transponder schedule.

Most satellites operating with 8-bit CPUs generally use 12-bit RAM systems to help reduce the effect of radiation induced memory errors. OSCAR-11 as well as the MicroSats run a "wash" routine as part of eir spacecraft's operating system. The wash routine checks all memoryocations, counting all errors and correcting all single bit errors. A "wash pointer" reports the current memory address checked and transmits thanformation as part of the spacecraft telemetry report.

OSCAR-11 has been used quite extensively to study the problem of single event upsets on spacecraft systems. In fact, it is an interesting hobby to find correlations between radiation induced spacecraft RAM errors, space dust counts, and ionospheric HF radio propagation conditions!

Most SEUs occur around the polar regions of the Earth, especially around an area known as the "South Atlantic Anomaly", a heavily proton charged

region around Antartica. Solar flares are also responsible for increasing
the rate at which SEUs occur in satellite computer subsystems.

I never had many problems with bandswitches on MY Drake equipment. But then I think that's because I kept using them. The only occasions that problems DID occur followed long periods of non-use. Running the switch through its range a few times fixed it right up good as new.

>10.25 GHZ Oscillator
>Does anyone know a source for a cheap 10.25 GHZ oscillator ?

Lee

I use door openers (Solfan(TM) and similar) or radar gun transceivers
(NEC ND751) with good success. See Ham Radio Magazine Feb/June/Oct 1988
for a phaselocked 10 GHz transverter design using these. Also these
are the types of units I used in the Dec '89 HR/91 handbook microwave data link.
  Flea markets are good places to get them. You might also try WB6IGP
in the San Diego Microwave Group. Chuck had a stash of them at one time.
Also try:

SHF Microwave Parts Company
7102 W. 500 S.
La Porte, IN 46350

Who has a flyer advertizing several types in the $20-$40 range.

Hope this helps.

The J-pole is just a dipole, end-fed with a quarter wave matching section. The advantage of a J is that it doesn't need a groundplane and it has a one-dimensional design, which makes it better suited for some applications, like portable operation.

I'm at a loss to explain how a rubber ducky could outperform the J. I've never seen this to be the case. Did you try both antennas in several (outdoor) locations ? Was the orientation of the antennas the same ?

>This "element 1A", etc., stuff baffles the crap out of me.

Since this very topic counts for several questions in the Extra exam pool, you'll need to know this. :-o   I looked at the pool a couple months ago, so I've probably gotten this all wrong, but I'm sure a kind VE will correct this if I'm wrong.

The code elements are 1A, 1B, and 1C, corresponding to 5, 13, and 20 wpm. Passing a higher speed code test implicitly passes the lower speed tests.

The written elements are 2A, 2B, 3, 4A, and 4B, corresponding to the Novice, Tech, General, Advanced, and Extra class licenses. Unlike the code test, each test has unique information, so you must pass each one. It may be true that all you need are the Advanced and Extra class question pools, since much of the technical information is built on previous elements. The last guy I know that tried the first 4 tests in one sitting said that it was hard to keep all the band limits straight, which usually count for several questions on each test.

The story I've heard is that you put a little propeller in front of
your radiator, tuned to the radar frequency. The propeller, spinning
in the breeze, adds so much speed to the Doppler, that the patrolman
thinks his equipment is bonkers, and ignores you.

This probably belongs in rec.urban.legend.

->This is one question I have had myself.
-
->I have never seen explicit mention in the FCC rules prohibiting FM on
->frequencies below 29.000 MHz. However, it is a fact that the only
->frequencies where FM is practiced on HF are between 29.000 and 29.700,
->especially between 29.100 and 29.300 plus between 29.500 and 29.700...
-
-I think the answer is bandwidth limitations. Above 29 MHz, the rules
-permit "wideband" FM. "Wideband" means "wider than an equivalent AM
-signal." Note that what is called "narrowband" FM on VHF (5 kHz deviation,
-about 13 kHz bandwidth), is not legal below 29 MHz.
-
-FM is quite legal on 75 meters (last time I looked), but you have to
-limit the bandwidth to 6 kHz, which means very narrow deviation.
-

You're quite right in saying that bandwidth is one of the limiting factors
of FM under 30MHz, but there are a few places where FM voice (F3E) is not
allowed (some are the obvious novice/tech parts):

3500-3750
7000-7150
10100-10150
14000-14150
21000-21200
24890-24930
28000-28300

Note that "On frequencies below 29.0MHz, the bandwidth of an F3E or G3E
emission (frequency or phase modulation) shall not exceed that of an A3E
emission having the same audio characteristics." Title 47, Part 97.65(c) CFR.

> Has anyone out there built their own 33MHz home computer?

       Depends how well the chassis fits together.  RFI may come
       from cracks, seams, holes, or cables.  Normally from cables,
       with the video cable (to the monitor) being a major culprit.
       Try adding a ferrite core around this cable at the computer
       end.  Other cables may radiate as well; try ferrites on RS232
       or printer cables.  When you get your system, unplug cables
       one at a time while listening to the interference on your radio.
       This may help you isolate the problem.
>
> Can anyone recommend particular mail-order vendors that they've
> purchased RF-quiet systems from? Or warn me about systems that were
> poor in this regard?

       Just remember that in general, the higher processor speeds
       (33 MHz) usually mean more RFI.  "Grounding" your equipment
       generally will not help the problem, as the coupling
       "mechanism" is usually direct radiation from computer to
       radio.

I have seen various sources selling surplused "door actuators" which
operate at 10.5+ GHz.  These are really doplar-activated switchs used
to open supermarket doors, etc.  The prices hover around $20 and
they could almost certainly be tweaked downwards to 10.2 GHz.

In the recently posted instructions for the twin-lead J-pole antenna described by N6UBM, the coax center conductor is connected to the long part of the J and the braid to the short part. These connections are the reverse of what is decscribed in the copper-tubing J-pole antenna. The ARRL Antenna Book also describes J-pole antennas and says to connect the coax center conductor to the short side of the J and the braid to the long side.

Is there a typo in the instructions for the twin-lead J-pole? Or does it just not matter at all?

>So here are my questions:

The following answers should be considered as opinions, not facts:

>If I purchase a system which is FCC class B certified, can I be
>reasonably certain that I won't have a problem with RFI?

No. FCC Class-B is not a very tight spec.

>If I purchase individual components (high-quality stuff, of course!)
>and assemble a system myself, am I more likely to have RFI problems?
>Has anyone out there built their own 33MHz home computer?

Possibly. One would hope that vendors who sell systems would have
tested them to FCC class-B specs AS SYSTEMS, whereby individual
components have been tested with "representative" other equipment
attached. By the way, commercial (non-home computer) equipment
is tested to FCC class-A which is NOISIER (worse).

>Can anyone recommend particular mail-order vendors that they've
>purchased RF-quiet systems from? Or warn me about systems that were
>poor in this regard?

Dunno.

There is a satellite phone service that can be used nearly anywhere on
the earth. The antenna isn't real small, but you can take it with you.
It is expensive. From the Netherlands you must pay ~$11 / min. to
call a satellite phone.

>there was obviously a phone link involved on the US end at least,
>but the reporters on the scene were using a *microphone*, not a
>telephone to talk into.

Connect a junction box to to the satellite phone and wire the microphone
and headphone. This is standard practice for news reporters. Only
normally they using the public phone system.

randall@informix.com (Randall Rhea) writes:

>"Ricebox" is intended to be a derogatory term aimed at a particular
>nationality. This, to my mind, is "racism." ...

As I recall, "ricebox" was a term coined at the end of the era when 2m
FM operators were "real hams" instead of appliance operators, i.e.,
they used Motorola and GE commercial-band equipment modified for the
ham band. "Ricebox" was more derogatory of the owner of the radio
than of its Japanese manufacturer. "Riceboxes" were typically more
sensitive and versatile but lacked shielding and front-end filtering,
making them unusable in RF jungles like downtown Chicago.

I'm reminded of Isaac Asimov's "Foundation Trilogy" (now with several
additional volumes) in which he remarks upon two kinds of stuff,
"Empire products" and "Foundation products": Products of the stagnant
and corrupt Galactic Empire were flawless in design and performance
but were enormous and heavy. (Rolls-Royce automobiles, Collins R-390
receivers and Motorola Micor VHF-FM rigs come to mind). Products of
the more progressive "Foundation" had a different engineering
philosophy; they performed as well, had extra features, and were
small, light and cost-effective.

Actually, I was surprised how easy it is to put the formula into an HP calculator which can do complex arithmetic. The formula is

```
                 /                            \
                | Z  + Z  * tanh ([gamma] * l) |
                |  L    o                      |
   Z(l) =  Z  * | ---------------------------- |
            o   | Z  + Z  * tanh ([gamma] * l) |
                |  o    L                      |
                 \                            /
```

where

```
     Z  = characteristic impedance
      o
     Z  = load impedance = R  + jX
      L                     L     L
     tanh = hyperbolic tangent
     [gamma] = propagation constant of medium
             = (attenuation constant) + j (velocity_factor / wavelength)
     l = distance from Z  to Z(l) (in same units as [gamma])
                        L
     wavelength = light_speed / frequency
     attenuation_constant = [nepers per unit length]
     velocity_factor = relative propagation speed in the
                       transmission line
```

Of course, the definition of the propagation constant would change if
you wanted to talk in terms of wavelength (electrical length) rather
than physical length. Anyway, I don't have the program here, but it
wasn't too many steps on an HP-42S.

For those of you who want to pretend that the line is lossless, you can
replace the "tanh's" above with "tan's" and [gamma] with (velocity_
factor / wavelength).

Tally ho,
Marshall Jose WA3VPZ

>-   What (legal) frequencies are available to me unlicensed?
>-   What (legal) frequencies are available to me licensed?

The Dep't of Communications (DOC) has a number of frequencies available for short term, temporary use. You do not need a license to use these frequencies. Contact the DOC for a list of these frequencies (and power limits, time limits, etc). There is one around 150 MHz that should work fine for your purposes. Be aware though that you have to accept any interference from other users of these shared frequencies. I also suggest that you give the DOC the impression that you will be transmitting voice, not data :-)

>-   Should the digital encryption be done on the transmitter
>   side or should the transmission be sent as analogue data
>   and digitized at the receiver? ASCII? PCM? FM? SSB? ???

Since you have two different pieces of data to send you're best off sending it digitally, allowing you to mux the values together. It should be pretty easy to do. Mount the A/D converters on the cart, feed the data through a mux circuit, run that through a D/A to get audio tones (use a 555) and feed that to the transmitter (an very used very cheap commercial VHF handheld).

If you want to spend mucho bucks, check out the Kantronics remote telemetry unit that's advertised in the ham rags. No idea on price, but I'll bet it aint cheap ...

As quoted from <17186@csli.Stanford.EDU> by kawai@csli.Stanford.EDU (goh kawai - n6uok):
+---------------
| I have never seen explicit mention in the FCC rules prohibiting FM on
| frequencies below 29.000 MHz. However, it is a fact that the only
| frequencies where FM is practiced on HF are between 29.000 and 29.700,
| especially between 29.100 and 29.300 plus between 29.500 and 29.700.
| (29.000 thru 29.100 is primarily the AM subband. 29.300 thru 29.500
| is the satellite subband. FM can be used in both subbands if it will
| not cause interference.) It is also a fact that in some countries, FM
| is indeed limited by law to the higher portion of 10 meters.
|
| Is there any legal limit on bands we can use for FM? Does anybody know
| for sure?
+---------------

I just CAREFULLY read the copy of Part 97 in the ARRL's rule book. The extent of its statements about FM on HF is to assign the following note to HF band sections where voice emissions are permitted:

$97.307 (f) (1) No angle-modulated emission may have a modulation index greater than 1 at the highest modulation frequency.

(Angle modulation, you will recall, means either frequency or phase modulation.)

My guess is that we don't use FM below 29.0MHz because it uses quite a lot of bandwidth compared to SSB (not to mention CW).

Keywords: QRP, Homebrewing, Mods to 30m, MC3362
Message-ID: <9920@b11.ingr.com>
Date: 17 Jan 91 23:35:58 GMT

Organization: Intergraph Corp. Huntsville, AL
Lines: 45

Greetings Hamdom:

I recently renewed my license after a 13 year break in any ham activity and am interested in CW again. The recent article in QST on the QRP rig caught my eye and am considering building this rig. I phoned the firm listed in the article as having boards/parts kit and obtained the following.

Portable QRP CW transceiver for 20 meters with:

- VFO tuning
- AGC
- 5 watts output
- Semi-QSK TR switching
- CW Sidetone

Complete kit including case	$ 159.95 + $4.50 shipping charge
Blank receiver board	$ 15.95
Blank transmitter board	$ 12.95

The article mentioned a signal strength meter but the person I talked to did not mention if it was included.
Does this look like a reasonable price for what you get?

The heart of the receiver is a VHF FM receiver IC from Motorola the MC3362. Anyone have any experience with this chip? How about cost?

20 meters sounds very crowded to me and I am considering modifying it to 30 meters. Has anyone else looked at this?
The VFO on the 20m version runs at 6015 to 6065 Khz and mixes with a 8000 khz IF to give 14,015 to 14,065 khz. If the VFO was modified to operate at 2100 to 2150 khz and some input coils were adjusted, you could move to 10,100 to 10,150 khz. What else am I missing here?

By the way the firm offering the kit was:

A & A Engineering
2521 W LaPalma
Unit K
Anaheim CA,92801
(714) 952-2114

Anyone ever dealt with them before?

- Ron Jolly KC4UGL

As quoted from <17190@csli.Stanford.EDU> by kawai@csli.Stanford.EDU (goh kawai -
n6uok):
+---------------
| something so badly, why mention it at all unless there is a vacant
| yearing in your soul groping for something better?  If you seek
| fulfilment, why not work harder to better your environment?
+---------------

Because, in the case of both the so-called "Jap riceboxes" and Radio Shack,
there is nothing we can do.  Were there 10 million hams in the U.S., we might
be able to push for better stores and more radios made (and serviced!) here
with our wallets.  Were there 100 million, companies would come to us instead
of the other way around.  As it is, we must live on sufference, because we're
such a small market that no company's going to "waste" resources on us.  Ah,
isn't the "bottom line" mentality wonderful!  :-(

Does anybody know if CNN audio can be heard anywhere on HF
(SSB feeds etc.). I live in the S.F. bay area and can't seem to
find any full-time CNN audio on any radio stations around here,
and I'm tired of the TV networks running CNN for a while then coming
on with their drivel.

Thanks,

Jon

Try the Kenwood TH-75.
The newer, zippier, more expensive model is the TH-77 (also smaller &

more functional but may have a bug which causes memory loss when battery is dead).

I have a Uniden Bearcat 100xl handscanner, and I am looking for ANY
mods that are available for this particular scanner.

If anyone knows where I can find some information, or that someone has
some 'mods', please send them to me.

The ICOM R1 Receiver seems to have a noise blanker when using the
AM mode.

I assume this can be defeated by a keyboard command. Does anyone know
what the command(s) would be to defeat the "Noise Blanker" "Automatic
Noilse Limiter (ANL)"?

Thanks in advance for any help.

A list of all the "secret" keyboard commands would be a treat.

I never said they weren't "friendly, normal people". They just think their high speed CW capability makes them better hams than those without that capability. Of course, there are also people who think the fact they are on packet makes them superior. Among the latter, those with 56 kbps think they're better than those who can only go 9600, etc., ad nauseum. In other words, they're not renegades - they're just people.

1. The code tests given are optional with the VE teams.

2. Most I"ve seen have been ultra-easy, to the point that a 13 wpm test is really an 8 wpm test and the usual 20 test only needs 15 wpm capability.
]

3. Nothing like the good old days, where FC\C gave you a 5 minute disjointed bit of text and you got a solid minute.

4. I've been at some sessions where I've been ashamed to sign the 610 forms. I had to, because the only cheating was by the examiner who made up the tests, and the examinees got the answers right. But:

5. Most teams have no idea how to construct a test. FI, almost all have as one question what are the callsigns given. Too easy.

6. Next to none of them test the punctuation.

7. And on and on.

8. I like a well-constructed true and false test. To pass you have to b e able to copy.

9. But most teams seem to want to be Good Guys and give the upgrades for the taking.

10. Who's kidding whom.

-- MAJOR SOLAR FLARE ALERT --

JANUARY 17, 1991

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare erupted off of the sun beginning at 14:55 UT, peaking at 15:02 UT and ending at 15:41 UT (event duration was 46 minutes). The flare was rated as a respectable class M6.9/1B energetic event. It was associated with a 350 s.f.u. (solar flux unit) Tenflare and a significant Type II sweep frequency burst event. The region responsible for this flare was Region 6455, which has exploded in growth over the past 24 hours. It now covers an area of approximately 330 million square kilometers and contains 17 visible spots within its boundary. It currently consists of a Beta type magnetic configuration in a type DAI optical pattern. It's location as of 18 January at 00:00 UT was S14W07. The location of the flare was S11W04.

Other regions currently visible are Regions 6444 (N15W50) and 6447 (S07W23). Region 6444 continues to span very large areas (3,840 million square kilometers with an angular extent of 21 degrees) and is by far the most impressive optical region visible, but has not succeeded in producing any flaring more energetic than class C x-ray events. Region 6447 is also quite impressive optically, but has become nearly dormant in flare output.

Solar activity should remain mostly low to moderate. No further major flaring is currently anticipated from Region 6455, although there is obviously a slight risk that it may produce surprisingly energetic activity. However, the data presently indicates that major flaring from this region will probably cease, although M-class flaring remains a possibility in this region, as well as in Regions 6444 and 6447.

POTENTIAL TERRESTRIAL IMPACT FORECAST

The association of this major flare with a strong Type II radio sweep indicates the distinct possibility that this event produced a coronal mass ejection. It is certainly well placed for producing terrestrial impacts, however it is important to note that no Type IV continuum radiation accompanied the Type II sweep. Hence, terrestrial impacts will likely remain relatively low.

There is a moderate to high probability that this flare will produce a sudden magnetic impulse within the next 48 hours or so followed by increased levels of geomagnetic activity and corpuscular radiation. However, the geomagnetic activity is expected to remain confined to mostly unsettled to perhaps active levels. There is a risk of minor storming over high latitudes. Middle latitudes should remain mostly unsettled with potential periods of active conditions. Worst case scenario's indicate potential minor storming over middle latitudes and major storming over high latitudes, however this projection is considered inaccurate considering the data collected thus far.

Auroral activity should increase coincident with the increase in geomagnetic activity sometime late on 19 January or 20 January. Activity is expected to be mostly moderate over high and middle latitudes.

Radio propagation conditions will likely witness decreased signal quality and increased fading, noise and distortion associated with the arrival of any enhanced corpuscular radiation. However, the conditions are not expected to be severely degraded. Relatively good DX should still be possible despite the expected increase in geophysical activity.

VHF auroral backscatter communications may become possible for high and northerly-middle latitude locations on 20 January, depending on the actual intensity of auroral and geomagnetic activity achieved. Any backscattering will likely be localized and sporadic.

It is entirely possible that we won't experience any geophysical impacts. However, the data would seem to indicate otherwise. Terrestrial impacts from this flare are currently expected to be relatively low, but should be measurable.

I don't want to destroy your dreams of getting rid of police radars but...
here in Italy police uses infrared or laser beams: two beams permit
measurement of speed and activate a photo-camera that is pointed to take
a picture of your plate. Bills arrive a few days later at home, together
with a sunspension of your driving licence...
What about a transparent radarproof car?

(add a big big smilie...)

I'd like to ask a question about a regular feature of the Info-Hams distribution. It is listed as "ARRL News" in the Table of Contents and is found in most issues. Here it is, in its entirety, complete, uncut, unabridged, and uncensored:

> ------------------------------
>
> Date: 18 Jan 91 05:15:19 GMT
> From: n8emr!root@tut.cis.ohio-state.edu (Root)
> Subject: ARRL news

You might wish to check your software. Our site has articles back to
1/4, and your posting is not here in rec.ham-radio.

(edited out)...

Why reinvent the wheel? Diana Syriac has already developed a series
of hypercard stacks that do much of what you propose. They are
excellent; I used them for Novice thru Extra. Email her at
dls@genrad.com.

Subject: Ramsey kits
Message-ID: <91019.151341UD186413@NDSUVM1.BITNET>
Date: 19 Jan 91 21:13:41 GMT
Organization: North Dakota Higher Education Computer Network
Lines: 19

I'm currently studying to take my novice exam, and have no equipment
yet. I have a couple of questions about the Ramsey kits.

Do you think that these kits would make good first radios?
(I have experience in electronics, and have built one of Ramseys

2m receivers, so building is not a problem. Is it possible
to use the VFO in a transmitter kit to tune a receiver kit (thus
making a small transciver)? Where would I get crystals to operate
on the novice bands?

A friend of mine leads a boy-scout troop, who are also studying
for their novice tickets, and he indicated intrst in buying
some of these kits for them after they get their liscences.

Any info/advice would be greatly appreciated!

Working for the competition just down the street from CNN world headquarters leads to a better grade of gossip. My understanding is that the CNN crew has their own flyaway satellite uplink pack on the roof of their hotel. When the power went off at the hotel (a Tomahawk said hello to the power station), they lugged car batteries to the roof. This only gave them enough power to run their SPSC talkback link to the satellite. Thus they were totally independent of Iraqi telcom. When the Iraqi ministry of communications found out what they were up to, the Iraqis watch CNN, they came over Friday morning at 11 am eastern time and made them pull the plug. As a late breaking note, the Iraqis have expelled all foreign correspondents *except* the CNN crew. The Iraqis are still letting the CNN guys file reports as of 5:58 AM eastern time 1-20-91, but are now censoring what may be said.

Nntp-Posting-Host: thesis1.hsch.utexas.edu
Originator: jmaynard@thesis1.hsch.utexas.edu

This is a formal call for votes for the proposed reorganization of rec.ham-radio.*. The discussion period started on December 4, 1990, and has run for just over the required 30 days (extended from the original ending time of 31 December 1990 due to the Christmas and New Year's holidays). Please read this entire posting before sending in your vote; the ballot to be used is at the end. I'm processing ballots automatically, and not following the instructions below may result in your vote not getting counted.

THE PROPOSAL:
=============

The following groups are to be renamed:

```
rec.ham-radio        => rec.radio.amateur.misc
rec.ham-radio.packet => rec.radio.amateur.packet
rec.ham-radio.swap   => rec.radio.swap
```

Groups will be renamed by creating the replacement group, asking site admins to alias the old group to the new one, and rmgrouping the old group after traffic in it has died down, hopefully about a month later. This method has been shown to work in other hierarchies.

The following groups are to be created:
rec.radio.amateur.policy
This group is intended to contain any and all discussion about policy issues pertaining to amateur radio, including, but not limited to, rules, regulations, laws, and legal actions by and against amateur radio operators. This group is to be unmoderated.

rec.radio.cb
This group is intended to contain discussions related to Citizens' Band radio. This group will be unmoderated.

RATIONALE:

==========

1. Why move the groups at all? The primary motivation is to make it easier for interested people to find newsgroups related to ham radio. The rec.radio hierarchy was created after rec.ham-radio (net.ham-radio before the Great Renaming). It is an inconsistency in the namespace to have groups for similar purposes separated from each other, and that makes it harder for new users to find the desired groups. Further, this allows a change from ham radio to amateur radio (see next topic).

2. Why .amateur instead of .ham? It has been pointed out in discussion that "ham radio" is primarily an American term, and carries little meaning outside the US. In addition, there are negative connotations attached to "ham" that don't apply to "amateur". Some confusion also exists in the public mind about just what a "ham radio operator" is, as evidenced by the occasional "ham operator jams aircraft frequencies!" when the person in question has never been a licensed amateur radio operator.

3. Why a .policy group? A significant part of the traffic in rec.ham-radio is concerned with issues of policy. This includes substantially all of the flamage, which has in the recent past included such subjects as whether or not it's legal to order a pizza via an amateur repeater, the proposal to add a class of license that does not require knowledge of the International Morse Code, and the legality of modifying amateur equipment to transmit outside the amateur bands. The new group is intended to move the flames and the long discussions that never seem to get anywhere out of the main group.

4. Why use the name .policy, instead of .rules, .regs, .regulations, etc.? The group is intended to contain any and all discussion about any policy issues pertaining to amateur radio. This includes not just rules and regulations of the FCC and other national regulatory bodies, but also laws affecting hams (such as the infamous New Jersey scanner law), lawsuits over nuisance issues, antenna ordinances, frequency coordination and band planning, and the like. .policy is the best name that has been suggested for the group out of many possibilities.

5. Why not a .tech group? There are two reasons for this one. The first is that there's more to ham radio that's non-inflammatory than just technical discussions, and the object of a new group is to move the flames, not run away from them. A .tech group would leave those of us who are interested in more than just technical discussions, yet not in the seemingly endless legal discussions, left to wade through the flames. Second, Brian Kantor, who maintains the info-hams mailing list, has said that info-hams will continue to gateway rec.ham-radio (and, presumably, rec.radio.amateur.misc) only, and moving the technical postings off would deprive those on the mailing list.

6. Why create a .cb group? There is currently no place for Citizens' Band radio discussions explicit in the hierarchy. These postings currently wind up in rec.ham-radio, where they tend to generate flamage all out of proportion to their volume.

THE MECHANICS OF THE VOTE:

The voting period will run from Monday, 7 January 1991 until Monday, 28 January 1991. Only votes received during that period will be counted. Each proposal is a separate vote, and must be voted on separately under the Guidelines for Group Creation (which have been applied to renames as well in the past).

Please edit and send in the ballot below. Each ballot will be stripped of all but the From: line and the lines containing valid votes by an automatic process; I won't see any comments included. No individual acknowledgments will be mailed. Votes will be acknowledged en masse in a posting on Thursday, 18 January 1991, and complete vote results will be posted on Tuesday, 29 January 1991.

For each proposal, indicate your choice of a yes vote or a no vote by placing a Y or N, respectively, at the beginning of the line. The first character on the line that is either a Y or an N (case doesn't matter) will be counted as your vote on that proposal. You may abstain from any particular vote by deleting the line entirely from the ballot. An invalid line (one not containing a Y or an N before the "Proposal #n:" tag) will be treated as an abstention, as well. Mail the completed ballot to me at this address, jmaynard@thesis1.hsch.utexas.edu, with the characters "VOTE" somewhere in the Subject: line. (Again, case doesn't matter.) Replying to this message with your newsreader's mail reply command ("R" in rn, readnews, vnews, and vn; I don't know nn's commamd) will work fine. Votes posted to the net will be summarily ignored and may earn the poster a free flame from the net.police.

This is the way the Master Electrician exam is given in the state of
Georgia. You are required to bring a copy of the Southern Electrical
Code with you to the exam. This is a four hour exam and you'd better
already be familiar with the sections of the Code or you'll never
find the things you need in time. You are also questioned about Georgia
laws on billing and fair trade practices as well as the State Tax code.
Good test.

There are several problems from a business point of view with this type
of operation. Mainly there is no audit of audience size or demographics
available to allow commercial sales. Without solid commercial sales there
is no profit. Also, the intent of the 50,000 watt clear channel rules in
the AM band is to allow regional broadcast coverage already. At least for
the eastern two thirds of the US, WHO in Des Moine covers this nicely.
Their slogan is "From border to border and coast to coast and then some".
Other wide coverage stations are WLS Chicago, WOWO Ft. Wayne, WWL in New
Orleans, WBZ Boston, WLW Cincinati, and good old WSB in Atlanta. There
are several more, but those are the ones I listen to on occasion.

The ICOM IC-32AT may fairly easily be converted to transceive from 430 to 462 (I'm not exactly sure of the limits here). It has CTCSS and programmable (odd) splits. I have been very satisfied with its ham/ scanner performance. My only beef would be that during scan mode, the scan will resume after 15 seconds, even though you might be listening to a station at the time. Other radios allow for several scan "modes" which allows the user to specify the most useful mode for the situation. Also, the scan rate is a fairly low 6 ch/sec.

I'll be visiting Hawaii on business near the end of February and would like to get on the air if possible. I thought of bringing my rig but with the airline security the way it is and the fact that I need to carry lots of other stuff I'd rather not have the hassle. Plus, it will be tough to get a decent antenna up where I'll be.

Does anyone know any ham(s) on Hawaii (near Hilo or anywhere else I guess) or on Oahu who I might be able to visit and guest-op for a little while? I'll be stopping on Oahu for a day or so and then on to Hawaii.

Any suggestions are welcome...please e-mail to me at the address below.

> for use in a vehicle mounted dead-reckoning navigation system.

You might have a difficult time in the design and winding of the flux gate itself, which is not a trivial undertaking if you hope to achieve any reasonable accuracy and linearity! While there are single-phase rectilinear flux gates wound on a straight core, it is more common to see two-phase and three-phase flux gates wound on toroidal cores. I cannot give you any practicable details for winding your own flux gate, however.

> We can't really use other methods of navigation like Omega or Nav-Star
> since 1) Neither are very well covered here
>   2) We need information about the current heading of the vehicle as well.

You should be aware that even the best quality military grade flux gates (commonly called a "north seeker", btw) have an accuracy of no better than +/- 1 degree of azimuth, with lesser quality military grade models having accuracies of +/- 3 degrees of azimuth. Commercial devices degrade from there... :-) I point this out because some people incorrectly believe that flux gate devices have greater accuracy than the above.

> Has anyone had experience with these beasts ? Likely problems/ shortcomings
> etc.
> In particular
>   1) How do you negate the magnetic effects of the vehicle itself ?
>   (bearing in mind we have overhead tram lines here !)

Using small adjustable compensation magnets, which are internal to some flux gate devices. A traditional marine approach is to use the large ferrous mass of a binnacle, but that is not to practicable for a car. :-)

>   2) How do you negate the effects of vehicle tilt (That is, the
>   verticle component of magnetic field biassing the readings ?

Many military and commercial aircraft flux gates are mounted on gimbals to provide pitch and roll tolerance of up to 45 degrees.

For further information on flux gate devices, you might wish to try a flux gate manufacturer, such as Humphrey, Inc. or Sperry

Navigation Systems.

Yes, there's lots of action from about 3095 to 3635, the RATS net runs
weekday evenings @ 04:00Z at or near 3620.0. For some reason, the
Seattle area seems to be a hotbed of RTTY activity. The fly in the
ointment is that there seem to be some long-haul packet stations on
3618.0 or thereabouts, so when conditions are good they tend to rise
up out of the noise.

And for something completely different - on Friday last, about 06:30Z
or so, I found a group (I think at least 4 stations) of Asian fishing
boat ops having a chat net on 3555.0. They must have been close
on-shore, their signals were s7 to s9, although the loudest signal was
also the dirtiest; it sounded like he was transmitting from the inside
of a culvert. Fortunately they weren't QRMing anyone.

->telephone handset cord) do the same thing by stepping over the
->cord (i.e. walking in a circle), then the cord will take a very
->long time to kink. Ideally, never.

You also have to watch out for hand changing - you'd also be surprised how easily that will rotate the cord (generally a half turn for each ear switch, even if you switch, for example, from right to left and back again you tend to rotate it the same way each time, giving a full rotation.

->However, to me the prevention is worse than the problem. Paying
->enough attention to my (habitual) mike-handling takes more effort
->than periodically unkinking the cord.
->
->Such is life.   -73   Skip AA6WK

Ah, but if you trained yourself to NEVER kink the cord, then you would never have to unkink it, so you would never have to periodically unkink the cord.

I do not know if this works, though, I've never been able to train myself to not kink it - so I periodically disconnect the cord from the handset and let it untangle itself. (Hanging a heavy weight on the cord only makes it unwind differently than it would at rest, which means that your cord ends up kinked anyway).

Oh, well. We now return you to something REALLY important - whatever

it is thats currently going on in r.h-r (I'm about 2 weeks behind,
in case you could not tell by the age of the article I'm replying
to!).   :-)

I heard Baghdad up till war broke, but not since. BBC reports indicate
that monitoring is from Nicosia in Cyprus, and a reporter there once relayed a
very noisy, jammed transmission via his mike. THe signal seemed weak
with a chirping jammer of equal strength.

Has anyone heard anything from it recently, English or otherwise ?

I just got the latest HeathKit catalog and noticed that they've got their
Multi-mode active audio filter on sale for $70. Does anyone have any
experience with this filter?

I'm currently using a Heath SB-104A with a 400 Hz CW filter for CW on HF.
This rig doesn't have much to help filter out audio noise or adjacent signals
--I'm hoping that an active audio filter might help.

Any experience with this filter, or experience with a similar filter in the
same price range, would be appreciated.

After several passes I got a connection into U2MIR (not U2MIR-1).
I sent a single message up but their wasn't a control op on at the
time. Do they have any provisions to see at a later time the message
I sent or must I log into the bbs ? The window in the Northeast is
approximately 6 Minutes. My understanding is that they will QSL
right ?

Thanks

I heard a rumor that Icom is advertising a new dual-band handheld in Japan called the IC-W2. From the *sketchy* information I have it is a 144/440 transceiver similar to the 24AT but with true dual-band performance similar to the TH-77A. Also, a wide-band receiver similar to the IC-R1. Anyone out there with more info?

This topic has come up in comp.protocols.time.ntp, where they use it for time synchronization. The time on the satilites can be scrambled based on commands from the ground to reduce the accuracy. Military GPS decoders can decode the scrambling, of course, but not civilian decoders.

For a while, after the latest US-USSR treaties, the scrambling was turned off (ie, the time was unperturbed). However, shortly after Aug. 2, the scramblers were turned back on, and they accuracy of the (computer) clocks that synchronized to them went down accordingly.

So the answer to your question is yes, the signal has gone down, but it was some time ago. A side note, there have been several civilian GPS decoders shipped to the Gulf region...

milton

Disclaimer: my understanding of the GPS is limited to two lectures on the theory of operation, Phil's post on the coverage of B. on I-day, and reading comp.protocols.time.ntp, which is where most of this information comes from.

After reading the Illuminati trilogy (Wilson, Shea) I ran across a book called "The Illuminoids" by Neal Wilgus. subtitled:

> "In the past's darkest corners dwelled the secret occult orders
> that altered the shape of history. These were...
> The Illuminoids
> " A revealing expose of the influence on the government conspiracies
> behind today's most sensational headlines!
> "A stunning history of their legendary beginnings

With an introduction by R.Anton Wilson....

anyway:

the first 150 pages are commentary, the next hundred or so on a chronology, ending with addresses/bib

p.206 1950 - ..."Alleged CIA plot to introduce UFO contact ideas with "Little Green Men" stories and radio contact from space"...

p.207 1952 - ..."George Adamski meets Venusians in the California desert; alleged CIA plot to start a UFO scare. UFOlogist George Hunt Williamson, one of Adamski's witnesses, claims he witnessed ham radio operator establish contact with another world"

p.208 1954 - ..."Broadcaaster Frank Edwards fired for discussing UFOs on the air. Strange voice "from space" speaks from turned-off radios in Midwest US and London, warns against preparations for war."

p.209 1957 - ..."Unexplained short wave radio signals received worldwide."

1958 - ..."Ham radio operators in US pick up a male voice claiming to be Nacoma of Jupiter and warning of atomic bomb disaster in English, German, Norwegian and his own unknown language."

p.210 1960 - ..."Project Ozma, searching for intelligent signals from another part of the universe, receives unexplained signals from space."

p.211 1961 - ..."Unexplained transmissions from space monitored by ham radio operators worldwide; Bob Renaud, ham operator, allegedly makes contact with aliens."

p.213 1963 - ..."Unexplained radio transmission interrupts astronaut Gordon Cooper in unidentified language."

p.219 1965 - ..."Three Russian scientists reort receiving signals from space."...."Another ham operator, Sidney Padrick, makes contact with UFO aliens."

p.222 1968 - ..."Astonuats circling the moon interrupted by unexplained voices. Unexplained distress signals from Mid-Pacific received by radio station, "...

From a book titled "Modern Mysteries of Britian" comes a one page story concerning a 1977 (?) mysterious interruption of Southern TV's signal by an alleged space voice that warned of war for about five and one half minutes. The officials claimed it a "hoax" although there are many safeguards to prevent such things.

Didn't Tesla claim to be getting signals from space also?

What of the stories of receiving back a signal too soon after you had sent it, implying apparently some artificial retransmission.

I have heard claims of "censored" xmission by astronauts in which they supposedly speak about UFOs they see. (Can't bring myself to believe the story about "There is a Santa Claus" to be a codeword for UFOs)

The Southern TV story particularly intrigues me......

Comments, anyone?

(Don't worry, I'm not the type who thinks he's gettin space signals...)

I have a Uniden HR2600 that I am using with a Microwave Modules transverter to operate on 2-meters. Since my primary interest is to cover the 2-meter amateur satellite subband (145.800 to 146.000 MHz), I was wondering if there were any modifications that could be performed on the HR2600 to extend its frequency range to 29.9999 MHz. I tried the HR2510 mod on the 2600, and it did nothing.

Any information would be appreciated. Please e-mail your notes to me and I will summarize and re-post all information to the net.

Thanks!

73, de John, KD2BD

>Steve - W3GRG
>----------
  Steve,
  A few comments:
  Super Morse is a great program, but when I tried to use it for
  real live QSOs I found it lacking many important features (type
  ahead buffer with both sent and typed text displayed, stored
  messages, etc.) Super Morse's forte is as a training tool.

  I do have a simple circuit for SENDING morse which connects to
  the RS-232 port. I guess I'm too much of a purist to use the
  computer for receive. [Oops, OH NO, the no-code/DSP flames are
  about to start! ]

  I also have some experience with an MFJ interface and basically
  found that it really only worked well on very strong signals.
  Therefore, I rarely used it for receive.

  The PC-compatible software I presently use is called CW-1 written
  by N0BF. It's a good basic program for sending Morse code and
  does not have any receive capability. It works well, has a good
  feature set and I highly recommend it.

Selective Availability (SA) for GPS has been turned off for the Desert Shield/Storm effort. It has been off at least since early October of last year. Apparently, a large number of commercial units are being used over there and so SA is off. (Have you tried to buy a commercial GPS receiver lately?) To answer your question, yes SA is supposed to be on during a war. I don't know why it is not, but a guess would be that we don't have enough military receivers. GPS should not be much help to Iraq since their missiles don't use it.

Yes, differential GPS can be used to cancel the errors put in by SA. Using a single receiver, SA is by far the largest source of error. In a differential system, other factors like satellite geometry become the largest sources of error.

-- MAJOR SOLAR FLARE ALERT --

JANUARY 27, 1991

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

Another major energetic Tenflare exploded from Region 6471 today. The flare began at 14:39 UT, peaked at 15:50 UT and ended near 16:04 UT on 27 January. The flare, located at S14E59, attained a class X1.9/1B rating and was associated with a Type IV sweep frequency event. There are strong suspicions that this flare was a proton flare. Although no solar protons have been observed yet, a proton shock is expected to occur near 04:00 UT on 28 January. The proton event is expected to be relatively weak, near 20 pfu at greater than 10 MeV.

Region 6471 is expected to continue to produce major flaring possibly throughout it's transit on the solar disk (possibly for the next 13 days). Terrestrial impacts could become high as this region traverses the disk and crosses into the western hemisphere within the next 5 days.

Regions 6462 and 6466 are magnetically and optically complex, but are not producing any significant flaring. They do, however, have the capability of spawning major flares and could do so at any time.

The solar flux achieved a level of 301 today, the highest it has been since August 22 of 1990. It has jumped a whopping 57 points in the last three days alone (98 points in the last 6 days)! Active regions are continuing to rotate around the east limb in more active configurations than expected. The solar flux is expected to remain above 300 for at least the next several days (barring any significant decay in any of the regions currently visible).

There is a significant possibility for extended 6 meter openings due to the greatly enhanced solar radiational output. Please also note that a polar cap disturbance could commence near 04:00 UT if the proton shock presently predicted manifests itself on 28 January.

POTENTIAL TERRESTRIAL IMPACT FORECAST

This latest flare is expected to produce mostly active conditions. Active geomagnetic conditions are expected to begin late on 27 January or sometime early on 28 January due to the X10.8/SF major flare of 25 January. Impacts from this latest flare are expected to keep geomagnetic activity at active levels through to 29/30 January. There is a risk of high latitude minor to major storming (most likely remaining confined to minor storming). Middle latitudes should remain mostly active to very active with possible brief periods of minor storming. The predicted planetary A-index values for the next three days hover near 25, so periods of minor storming are quite possible over middle latitudes. High latitudes will be affected most strongly, with very active to minor storm conditions and risks of brief major storming.

Auroral activity will pick up on 28 January (UT time). High latitudes will witness moderate to high auroral activity. Middle latitudes will witness predominantly low to moderate activity. Radio communications near the auroral zones will be poor to very poor. Conditions will improve with distance away from the auroral zones. However, increased noise, absorption and flutter fading are possible over middle and low latitudes as the increased corpuscular radiation reaches the earth.

There is a chance of some isolated VHF auroral backscatter communications on the evening of 28 January and most likely also 29 January. The quality, duration and extent of the conditions suitable for such communications will depend to a large extent on the intensity of the flare impact. Presently, only isolated instances of backscatter are expected. If activity surpasses levels predicted, more widespread backscatter may become possible on the VHF bands.

Barring any further major flaring, conditions should improve by 30 January (possibly earlier). Major flaring is likely, however, so there is a chance that the activity could be extended into early February.

Reports of degraded radio propagation over the next 3 days would be appreciated. Please send any reports of degraded conditions along with a description of the conditions experienced, to: std_oler@hg.uleth.ca. Thanks.

** End of Report **

Hey, guys. I don't want to use the computer to send code. I just built the CMOS Super Key II and love it! And I don't want to use the computer to copy code either. I'm almost up to speed for Extra and I don't want to blow it now. What I want to do is experiment. Wouldn't a diode rectifier off of the speaker, with a suitable RC time constant after it, fed into an optocoupler, give logic level inputs to the computer? That's what I'm going to try, but I'd be interested in other approaches.

****
*** POTENTIAL GEOMAGNETIC STORM WARNING ***
****

Issued: 18:00 UT, 27 January

Geomagnetic Storm Warning

Attention:

Due to the recent major flaring and expected interplanetary shocks, a Potential Geomagnetic Storm Warning has been issued, particularly for the middle and high latitude regions. There is uncertainty regarding how intense the geomagnetic activity could become. Hence, a geomagnetic storm warning has been issued. Please note that this warning does not mean that a magnetic storm is in progress. This warning is meant only to alert those who could be affected to the potential for geomagnetic storming. Activity is currently expected to remain near active to very active levels for middle latitudes, but higher latitudes could sustain minor storming for extended periods. If geomagnetic storming does develope over middle latitudes, a Geomagnetic Storm Alert will be posted.

The estimated planetary magnetic A-index for the next three days is expected to be near 25. High latitudes could experience magnetic storming capable of pushing the A-index above 50. Middle latitudes will likely experience activity between 20 and 35. Low latitudes will likely observe A-index values of near 15 to possibly 30.

Conditions should begin to improve on 30 January (possibly earlier), barring any further major flaring (which seems likely at the present time). Watch for possible geomagnetic and/or major flare alerts.

** End of Warning **

> Does differential GPS totally get around this, or is there a trick
> they can use to defeat this technique?

Jeepers, Michael, why don't we just invite Saddam to sit in on JCS planning sessions and be done with it?

Newsgroups: news.groups,rec.ham-radio,rec.ham-radio.packet,rec.ham-radio.swap
Subject: VOTE RESULTS: rec.ham-radio reorganization
Message-ID: <4600@lib.tmc.edu>
Date: 28 Jan 91 12:22:34 GMT
Sender: usenet@lib.tmc.edu
Followup-To: news.groups
Organization: University of Texas Medical School at Houston
Lines: 280
Xref: gmdzi news.groups:24389 rec.ham-radio:19908 rec.ham-radio.packet:3466 rec.ham-radio.swap:941
Nntp-Posting-Host: thesis1.hsch.utexas.edu
Originator: jmaynard@thesis1.hsch.utexas.edu

The voting period for the rec.ham-radio.* reorganization is now over.
The proposals to be voted on were:
Proposal #1: Rename rec.ham-radio to rec.radio.amateur.misc
Proposal #2: Rename rec.ham-radio.packet to rec.radio.amateur.packet
Proposal #3: Rename rec.ham-radio.swap to rec.radio.swap
Proposal #4: Create rec.radio.amateur.policy
Proposal #5: Create rec.radio.cb

The results are as follows:
Proposal 1: 172 to 47...margin 125, percent in favor 78.538813
Proposal 2: 178 to 42...margin 136, percent in favor 80.909091

```
Proposal 3: 177 to 44...margin 133, percent in favor 80.090498
Proposal 4: 173 to 44...margin 129, percent in favor 79.723502
Proposal 5: 160 to 49...margin 111, percent in favor 76.555024
```

As you can see, all five proposals have passed, since all five have a margin of yes votes over no votes of greater than 100, and all five have more than 67% (2/3) of the votes cast being yes votes.

The five-day period of checking for duplicates and invalid votes begins as of the time that these results appear in news.announce.newgroups, per the Guidelines for Newsgroup Creation. If no problems that change the outcome of any proposal are found, then I will ask Eliot Lear to issue newgroup messages for rec.radio.amateur.misc, rec.radio.amateur.packet, rec.radio.swap, rec.radio.amateur.policy, and rec.radio.cb. In a month, I will ask him to repost the newgroup messages, and post rmgroups for rec.ham-radio, rec.ham-radio.packet, and rec.ham-radio.swap. I would ask sysadmins on the net to alias rec.ham-radio to rec.radio.amateur.misc, rec.ham-radio.packet to rec.radio.amateur.packet, and rec.ham-radio.swap to rec.radio.swap when they receive the newgroup messages - but not before.

Thanks go to all who provided input into the process of shaping this proposal. It started out as one man's idea, but quickly grew to encompass just about every input even remotely compatible with the overall objective. Thanks also go to all who voted - as you can see, every vote counts, as just 6 votes the other way would have defeated rec.radio.cb.

For those who keep track of when votes are received, 85 were received the first day, 128 by the fourth, 148 by the tenth, and 33 the day after the second call for votes was posted. Only 14 were received in the last week.

I wound up writing a shell script to massage ballots received into the format you see below, and an awk program to generate the report at the top of this message. Anyone who's interested in those pieces of cruft (really, they're not pretty - they just work), just drop me a note and I'll pass them along.

The votes received are listed below: (Y=yes, N=no, A=abstain)

```

> Has anyone noticed a degradation of the Navstar GPS system since the outbreak of unpleasentness in the middle east?
>
> The implication, when GPS was first started, was that during times of crisis the C/A code would be degraded so that an enemy could not use it.

Selective Availability (S/A) is a procedure by which the accuracy of Navstar GPS is degraded. It involves dithering the clock which controls all of the signals generated within a satellite as well as a deliberate degradation of the accuracy of the satellite orbit information transmitted by the satellite in its broadcast message. A de-cryption unit is required to remove S/A effects in a receiver used for absolute or point positioning. S/A had been turned on last spring as part of the on-going testing of GPS. However it was turned off in August at the start of the U.S. military build-up in the Gulf. The speculation on why S/A was turned off is that the U.S. did not have enough units with the de-cryption device installed. In fact, the DoD made a large purchase of civilian GPS receivers to outfit the troops. GPS will not be declared fully operational until the full satellite constellation is in place, likely to happen in 1993. By then the DoD likely will have the right radios so that they won't have to turn S/A off. By the way, at that time AS (Anti-Spoofing) will also be turned on. AS involves the further encryption of the P-code - the precision pseudorandom noise code.

> Does differential GPS totally get around this, or is there a trick
> they can use to defeat this technique?

Yes, differential GPS can get around most of the effect of S/A. But to do real-time differential, you need a radio link of some sort between the stations - something which would be an obvious target during hostilities.

When I eventually get a packet station put up at my home, I would like to be able to access TCP/IP capabilities. Just one problem (I think). I have an Apple][c computer. Can anyone recommend a book (or advice) on how I can access TCP/IP using my][c? Does any][software exist for this function?

Thanks much in advance.

I am looking for source code to control an Icom R-71A equipped with the UX-14 serial interface. I want to have something like UNIX cron to change the receiver's frequency and mode at a certain time, and then run some program on the host.

Maybe something like:

```
c:\crontab
----------
at 0000 gmt run c:\nam.bat

c:\nam.bat
----------
ic71freq 8078.2
ic71mode usb
c:\fax\hffax /a
```

The batch file would run at 0000 GMT, the receiver would be set, and the WEFAX program whould run.

Source code for a library of C functions which control the Icom radios via a serial port would make the above concept trivial. Simtel20 has a program written by Phil Karn, but it's for the parallel port.

Please reply via email. I'll post any leads if there is enough demand.

Chris

I've placed the Spring, Summer, and Fall issues of the NCPA Downlink (the newsletter of the Northern California Packet Association) in the ~ftp/pub/ncpa/ directory of vax.cs.pitt.edu (Thanks to Bob Hoffman, N3CVL, for providing an internet site for these files!). The files are available via anonymous FTP access.

They are compressed PostScript files, with this name mapping:

Issue	for unix	for PC
Spring '90	DL2.ps.Z	dl2.zip
Summer '90	DL3.ps.Z	dl3.zip
Fall '90	DL4.ps.Z	dl4.zip

Both versions contain the same .ps file, just in slightly different binary forms for FTPing convenience. There are no text only files available.

Briefly, the NCPA represents the Northern California packeteers, and the information in the newsletter reflects this slant. Since it is a quarterly, it doesn't have much timely information (some of us would like to think that the content of our newsletters is timeless... ;-). Since one of the major goals of NCPA is education, we thought that by disseminating our newletter to the amateur population at large we would better fulfill our goals.

We will release our newsletter in electronic form each quarter when we have the next quarter's newsletter completed. So, our members currently have the Winter edition, and we'll release the Winter edition electronically when our Spring '91 issue is ready, for example. So the electronic edition will be one quarter behind.

THIS IS NOT A MEMBERSHIP DRIVE, or anything of that sort! We just want to get some information out to the packet community. Of course, if you want to join NCPA, you're welcome to do that, and timely paper copies of the NCPA Downlink will be mailed to you.

Mainly, if you and the folks you give copies to end up benefiting ham radio packet, we all will win!

couldn't resist

>Live and LET LIVE. I doubt that using a computer to receive code is the
>FCC's idea of poor operating practice!

Never said it was. It is only silly. If you wanna type and have the other person read your words, than why choose cw over rtty or packet. Sending cw by computer at 100wpm is like computer generated art. It is nice, pleasing to the eye, etc. But is it art?

I just saw a GPS receiver for OEM applications. Output is RS232,422 and
several others. It's two boards (3.12"x7.4"x1.14") package. Price is $900
for complete package including receiver and antenna. Company is
Magellan Systems Corp. 260 E. Huntington Dr. Monrovia, CA 91016.
1-818-358-2363. the above is just what i read, i know nothing else about
them.

Randall Rhea's points are valid i agree if you are after buying equipment and are not too concerned about keeping it for a long time. However i tend to make major purchases with an eye to keeping it for a long time, and so repairability and spares availability are major concerns to me.
Most of the 'reviews' of equipment do not even attempt to do cost projections over, say, a 25-year lifespan. Most customers are seduced by advertising into buying 'features' that they do not need.
i admit that in many cases the Japanese quality control is rather good, but all the quality-control in the world cannot rectify bad electrical or ergonomic design that seems endemic in certain of the products sold to us hams, for example HT's that suffer terminal desense & intermodulation.
Unfortunately, it is usually true that gimmicks sell more than performance; given the choice between a gimmick and a performance-enhancement i would go for the performance enhancement every time.
How many advertisements do you see that promote the 'bells & whistles' side of a radio (number of memories, digital voice storage) yet fail to even state the shape-factor of the filters or the intercept points of the frontend? Dammit, am i buying a radio or a speech synthesizer?
Put a FT1000 up against a KWM380 (still available new!) and see what you have been missing all these years.
Remember - you cannot judge the dynamic characteristics of anything just looking at it in the showroom. Only living with it for 15 years will reveal the warts in the design; that is, assuming it *lasts* 15 years....

In a recent posting, Fred Lloyd gave a nice review of the features of the new TS850. Thanks, Fred!

Two questions:

1) Can you go from USB to CW without retuning? In other words, if you are listening to a USB station and switch to CW, is the USB still intelligible without your having to turn the dial?

2) Is there a separate transverter jack on the back? If so:
   a) how much power does it provide?
   b) is it TX or TX/RX?

Thanks in advance -
Mike

WA3TLD

CW Carrier Oscillator Modification
for TS-940S Tranciever
January 1991 Paul J. Dujmich

NOTE: This modification improves the function of the VBT variable CW passband control on the TS-940S tranciever when a narrow (500 Hz) CW filter has been installed. After the modification has been performed, the VBT will be usable to the most NARROW counterclockwise position giving a CW narrow bandwidth of aprox. 150 Hz.

Background

The TS940S has 2 carrier oscillators, one for Upper Sideband (adjusted by TC1 on the CAR board), and one for Lower Sideband (adjusted by TC2 on the CAR board). The CW wide and narrow modes use the USB carrier oscillator, and the FSK mode uses the LSB carrier oscillator. TC3 on the CAR board is NOT a cw carrier adjustment. TC3 adjusts the 9285 khz hetrodyne oscillator. When a narrow CW filter (500 hz) is installed in the 940, a problem can sometime arrise. The High IF CW filter is supposed to have it's passband centered at 8830 khz. The low IF CW filter is supposed to be centered at exactly 455.0 khz. The manufacturing tolerance of either CW filter is about +/- 70 hz. Thus, no two cw filters are centered at exactly the same frequency. 70 hz dosen't sound like much of an error, but when you consider that the entire bandwidth with the cw filter switched in is only 500 hz, the error can be as much as 70/500 = 14%.
Thus, in some cases, the cw filter is not exactly centered at 8830 khz for the high IF filter or 455 khz for the low IF filter. To correct for a filter that is not exactly centered, you can adjust the carrier oscillator. The procedure to accomplish this is to tune the crystal calibrator in at 7100 or 14100 khz in NARROW CW mode and adjust TC1, the USB carrier oscillator for maximum S-Meter reading on the calibrator signal. This methos works fine, and exactly centers the narrow cw filter passband, BUT, in adjusting TC1, you detune the USB carrier oscillator for Upper Sideband. In most cases, you won't notice that much difference on USB, but your USB audio will sound slightly on the high side. You are optomizing the USB carrier oscillator for CW at the expense of USB. Since Kenwood didn't include a seperate CW carrier oscillator trimmer on the CAR board, this is about the best you can do without modifying the radio.
A SOLUTION TO THE ABOVE PROBLEM WOULD BE TO ADD A SEPERATE CARRIER OSCILLATOR ADJUSTMENT TRIMMER FOR THE CW MODE ON THE CAR BOARD.

Another problem appears when you try to use VBT with the narrow CW filter installed. When you adjust the VBT (Variable Bandpass Tuning), you are really changing the frequency of the USB carrier oscillator (CAR 1), and the hetrodyne oscillator, 9285 khz, (CAR 2). By changing these two hetrodyneoscillators, relative to the 455 khz passband, the net bandwidth is narrowed.
Actually, all oscillator frequencies in the radio are varried when you vary the VBT control, except the master 20 Mhz oscillator. The CAR 1 and CAR 2 signals are changed by the master CPU, a Z80 microprocessor. When you vary the VBT control, the Z80 CPU changes the amount of frequency division that can occur in IC1 and IC2, the two carrier oscillator Phase Locked Loops on the CAR board. If the narrow CW filter is not centered in the 8830 khz or 455 khz passband, the Z80 will move the carrier oscillator signal to the wrong place within the passband. You can tell if this is happening by turning the VBT control to maximum counter-clockwise while in NARROW CW mode. If the received signal drops considerably down in strength at this VBT position, then the carrier oscillator is not properly placed.

Another contributing factor is the rate of change of the CAR1 and CAR 2 signals. It seems that when the CPU changes the amount of frequency division on the IC1 and IC2 PLL'S, the high frequency oscillator (9285 khz), changes at a much faster rate than the low frequency oscillator (455 khz) does. Thus when you adjust the VBT to the most narrow position, the 9285 khz oscillator has moved too much, relative to the 455 khz oscillator.
This rate of change problem with the two oscillators cannot be fixed with a simple modification. However, the rate of change problem can be improved considerably if a seperate CW carrier oscillator trimmer adjustment is added to the carrier oscillator circuit board (CAR board).

MAKING THE MODIFICATION

Add the following circuit to the CAR circuit board. You will be adding a small trimmer capacitor that will serve as the CW carrier oscillator adjustment. It will be necessary to drill a 1/4 inch hole in the CAR board metal shield for access to the trimmer capacitor.

(1) Add this circuit to CAR Board

```
                                         1 K         120 uH
 To CWB  <-----------------------------\/\/\/\/-----OOOOOOOO-----
 Connect to jumper     |          |                   RFC       |
 W102 on IF board      |          |                             |   1N914
                      ___ .01 uF  \                             |---->|-----
NOTE: CWB = 12 V      ___         / 47K                         |  Diode   |
      in CW Mode       |          \                    2-30 pf  |          |
      CWB = 0V in      |           |                  Trimmer  ___ ^       |
      all other        GND         GND                 Cap     ___ |       |
      modes.                                     (CW Carrier    |  |       |
                                                  Adjust)       |          |
                                                                |          |
                                                                GND        |
                                                                           |
                                                                           |
                                                               <-----------|
                                                            To Cathode of
                                                            D1 on CAR
                                                            Board
```

This Circuit permits seperate adjustment of the carrier oscillator in CW mode, seperate from the USB and LSB adjustments.

(2) Capacitor change on CAR Circuit Board.
Replace C5 (a 10 pf disc ceramic capacitor) with a 5 pf disc ceramic capacitor. This change compensates for the capacitance of the 1N914 diode that was added in step 1 above.

(3) Control Modification On IF Circuit Board.
Modify D109 on IF board by cutting the cathode lead as shown in the diagram below. Add two new 1N914 diodes and connect them as per the diagram.

```
 ------------------------------------------------------------> To USB Carrier
 |              |          |                                    Enable
 | Add new      |          |                                    (No change
 - Diode        -  Add     |<--- Cut this lead                  Necessary)
 ^ 1N914        ^  new     -     of D109
 |              | diode    ^
 |              |          |-----> (CWB OR FMB)
 |              |          -       No change necessary
 |              |          ^
 |              |----------|
 |                         |
 |                         ----> AMB (No change necessary)
 |
 |
 |--------> To Anode of D101 (FMB)
```

(4) ADJUSTMENT (Adjust the following trimmers on CAR board)

Set mode to USB, CW Wide/Narrow to Wide, VBT fully CW
Adjust TC3 to 9285 KHZ as per Kenwood specs.

Adjust TC1 to 453.5 KHZ in USB mode as per Kenwood Service Manual specs.
Adjust TC2 to 456.5 KHZ in LSB mode as per Kenwood Service Manual specs.

Set CW Wide/Narrow to Narrow, set VBT fully CCW to most narrow position. Turn on the crystal calibrator, and tune the main tuning knob to 7.100.00 Adjust the new added trimmer capacitor (CW carrier adjust) for maximum calibrator signal on the S-Meter. This centers the carrier in the middle of the 455 KHZ passband with VBT in it's most narrow position.

After I made the modification, the VBT was usable to about 9 O-clock in the CW wide mode, and it was usable to maximum CCW (most narrow position) in CW Narrow mode. VBT performance on AM, FM and FSK will be unchanged, since these modes use the LSB and USB carrier oscillators. The performance on USB and LSB will be exactly as per Kenwood Service manual specs. CW bandwidth will be adjustable from 2.7 KHZ to 150 Hz.

Having those oscillators on frequency would be necessary. putting them on
to within a hundred hz shouldn't be a big deal.

>A related problem for ALL digital displays is what does the displayed
>frequency really mean for a cw signal? Is it correct when the beat note is
>tuned to zero?

> If so, its not very useful since you can't hear the signal
>then. To be correct, it should take into account the bfo frequency and
>the center frequency of the filter being used. Do any displays do that?

This can get rather ambiguous. A receiver may have a variable BFO, or it
may have adjustable filters. I would say that if the BFO is tuned to
the IF, and the filters are centered on the IF, and the CW signal is
zero-beat, then you are tuned to the frequency of the CW signal.

On transmitters you can have the problem where CW is generated as a tone
which is fed to a single-sideband transmitter. The actual transmitted
signal is then about 1 khz off of the displayed frequency. The manual
should tell you how much and which direction.

>Since most receivers with digital displays do not have crystal calibrators,
>there is no simple way to answer this question without an external
>signal source of known frequency.

Try WWV.

I want to get my Ham Radio license and I would like a good morse code progra and (if one of available) a program to test me on the theory questions. I am planning on trying for Technician class. Any assistance in locating shareward/PD versions of programs like I listed above would be appreciated. Please e-mail responses since I don't read this list on a regual basis.

>p.206 1950 - ..."Alleged CIA plot to introduce UFO contact ideas with
>   "Little Green Men" stories and radio contact from space"...

[other UFO stuff deleted]

I've been ripped off. I've got a copy of the Illuminoids by this guy but this
edition has only got 189 pages. I think it's a conspiracy :)

Seriously, judging from the table of contents and the blurb on the back, it
doesn't seem to have anything to do with aliens (I haven't read it yet).

The blurb on the back of the book is as follows:

On the first day of May, 1776, Adam Weishaupt
founde his legendary Order of the Illuminati.
The dark underside of the Age of Enlightenment had
given identity to a tradition dating back to the dawn of
civilisation.

Was Graud, ruler in mythical Atlantis, the first
Illuminatus? [Sounds good to me :]

Were the great modern conflicts - from Flanders
trenches to Mao's revoluion - prompted by Illuminoid
conspiracy?

Leon Trotsky, Robert Kennedy, President Garfield...
were they victims of assassins primed by the Illuminati?

Are Robespierre and Lee Harvy Oswald linked by a
developing brain-control technology that will produce
a real-life 1984? [This sounds even better! Bene Gesserit move over!]

Neal Wilgus traces the bizarre and chilling history of
the Illuminated and their recurrent influence on the
loing march of civilised man towards the twenty-first
century...

It seems that the Illuminati are more concerned with political power and conspiracies than UFOs.

>I have heard claims of "censored" xmission by astronauts in which they
>supposedly speak about UFOs they see. (Can't bring myself to believe
>the story about "There is a Santa Claus" to be a codeword for UFOs)

The only thing like this that I've ever heard about is a tale about astronauts seeing very large machinery parts on the moon and saying something like "What the hell's that?" before being cut off. My brother's has a book about it saying that NASA has photos of these huge screws and things lying around on the moon.

It sounds like a great UL to me. I mean, how would anyone know about it if NASA didn't want them to? I'd better read the book. Has anyone else heard this?

Helly Everyone.... I am looking for some further help on the modifications that I made to my FT-470. Recently a gentlemen posted some mods for the 470 that worked just as they said they would. Actually I only tried the one mod for extending the receive capability on the UHF band of the radio. The radio now receives from 430-500 MHz just as the mod said, but it also only transmits from 430-440 Mhz, also what the mod says. I am looking for more information on how I might be able to regain my transmit ability from 440-450 Mhz. If the person who originally posted the mod (Peter G6ZYT) or anyone else can help with this please reply! I know that peter had a European version of the radio to begin with, so he didn't lose anything when he made the mod to receive up to 500 Mhz on UHF since 430-440 is the European limit.

73's and thanks in advance! Please either send replys to me or just post on the net! JON KC4NWK

Yes, I remember this. I was still living in the UK at the time. It seems that some clever sod got hold of some surplus microwave equipment and drove up close to some microwave relay tower. He managed to get enough signal into the receiver to more or less overpower the legitimate signal. As you mention, it only lasted a few minutes.

I think he called himself "Gallon the Galactic." I also think he was later caught and prosecuted. Probably made all the broadcasters think long and hard about their security!

%>KA9AHQ
%
% Sounds like a fun idea. What it would require though is a fairly
%directional antenna. (or is that really true? could you just use a
%kinda-non-directional antenna and rotate it until the signal is nulled?)
%What do you recommend for the "average" swl'er who would like to try this?
%The signal strengths of many of these stations that I've noted are
%reasonably high, so would a short (maybe 5-10 ft) rotatable dipole or
%"long"wire be a good choice? Please post some suggestions as to antenna and
%methods.

If we could only take a couple of readings we would need some fancy
antennas (Mommy can I have a Wullen Weber Array for Christmas?).
But if all we are after is "a city" and we can take many readings
then magic is not required.
A 10' dipole would no doubt do the trick.
A quick and dirty would be

```
 5' Antenna Mast           ---------                  5' antenna mast
```

```
---------------------------|       |------------------------------
                           ---| |---\
                              | |    \__PVC Plumbing Tee Connector
                               |
                                Some kind of mast
```

I kind of like antenna mast, the diameter is big enough to give fairly low
Q which considering the other atributes of this antenna is a plus.
10' section would probablt be better but PVC can only hold so much.

Just swing it till it nulls, and the pipe points to the source or
180 away. Mox Nix.

Once in a fit of desperation I mounted a short whip in a trash can.
AAARRRGGGHHHH but it worked, sort of.

I have used my TV antenna w/ rotor, Ugly but better than nothing,
I wont say how much.

To obtain your own location, go to a map store, or nautical chart store
(if you are coastal) or to the local (small) airport and look.
National Geodetic survey maps are cheap and good. RAn McNAlly used to
give lat and long over the phone based on a desvcription such as
200 feet east on 3rd ave from the intersection of 3rd and James,
The fifth house. I dont know if they still do, or if they charge.
Or you can buy a sextant.... never mind :-)
Frankly for net posting something like
"In St Louis MO, 2 miles SSE from the interestion of HWYS 24 and 32"
would be more than adequate.

I hope thats food for thought.
Ed

>What it would require though is a fairly directional antenna. (or is that
>really true? could you just use a kinda-non-directional antenna and rotate
>it until the signal is nulled?)

How "kinda-non-directional" we talking about? If you rotate an antenna to find a null, this "sorta" means that it's gotta be directional. The more the better, else the null gets really broad. Say you have as little as a ten-degree azimuth for your null. This translates to a possible directional error of 10 miles for each 60 miles you are from the transmitter. If it is 3000 miles away, your null could include a station anywhere on a 300-mile long arc. A bi-directional antenna would find the null at two places, 180 degrees apart, so the station might be on either of the two 300-mile long arcs.

Now, if a large number of stations DF a transmitter, and someone with patience *accurately* plots all the LOP's, eventually one could maybe get the area "pinpointed". Without extremely accurate nulls and bearing information, finding the exact location of a transmitter from any distance away is awfully hard to do.

<koning@koning.enet.dec.com (Paul Koning)> writes:

>So in other words, Jim is right. A Novice license proves you passed 1A,
>and will continue to do so after 2/14.

And phil@ux1.cso.uiuc.edu (Phil Howard KA9WGN)> replies:

>Yes, a Novice license does indeed prove the holder passed 1A. However the
>rub is that the new rules in effect Feb 14, don't ask for ANY proof, they
>SPECIFICALLY ask for that proof in the form of a CSCE. THIS is the problem!

Seems to me that the sensible way to do it is to couch it in terms of exam elements required. Then it would make no difference whether the 1A element were passed at a "two-generals" session or at a VE session. And it would eliminate the arguments surrounding the CSCE issue. As always, credit for previous elements passed would be reflected by the type of license held at the time the exams were taken.

No License to Novice 1A 2A	No License to Tech 2A 3A (no HF)	No L. to General 1A 1B 2A 3A 3B
	Novice to Tech+HF 3A	Novice to General 1B 3A 3B
(Note that Novice does not go to a "codeless" Tech)	Tech to Tech+HF 1A	Tech to General 1A 1B 3B
		Tech+HF to General 1B 3B

What could be simpler? Or is it that simplicity doesn't play well with today's Hams?

The real problem, and the one I posted just after the new structure was announced, is: How you gonna tell the Techs from the "Tech+HFs" without some kind of call sign differentiation? Some have complained that this will result in on-the-air discrimination, and I'm sure that some of that will occur. But it's not JUST a matter of on-the-air discrimination. It's an administrative problem that must be dealt with, and this thread has properly identified it. THE FCC and ARRL ought to fix their mess.

-frequency something is working on. For instance, if I was on 144.25 I would
-want the counter to be able to tell me that. Is there such a thing or am I
-just dreaming about nonsense?

Sure. It is a frequency counter. I built one (the Optoelectronics kit), and have used it to find out various HT frequencies (AMTRAK, etc.) All I did was connect a duck to the input and stand within 10-15 feet of the transmitter. What would be nice would be to have a counter as part of a scanner, to save having to carry 2 boxes and entering the freq from one to the other.

>144/440 transceiver similar to the 24AT but with true dual-band
>performance similar to the TH-77A. Also, a wide-band receiver similar to
>the IC-R1. Anyone out there with more info?

The advertisement for the Icom IC-W2 dual band handie on p. 25 - 27 of the December 1990 issue of CQ Ham Radio [Japan] states that the ultra-slim W2 receives simultaneously on two bands (144/430) [Japanese version of course] weighs 450 grams and occupies 170 cubic cm. Features include programmable and memory scanning, 66 channel memory, clock/timer, large LCD display pager/code squelch, and dual band design which makes it possible to use these features independently on both bands. The price is 62,800 yen excluding VAT tax in Japan. The power level is selected in four steps up to a maximum of 5 watts.

A small 6 meter handie, the IC-alpha 6, costs 19,800 yen.

The ad pictures the handie with playing cards which are only slightly shorter than the IC-W2. Unlike the recent ads for Kenwood and Standard, no lovely YL joyously using the radio. Perhaps Icom concentrates on making radios.

As a followup, here are some questions that I've received about my article:

>> From: Wayne Cronin wmc@phx.mcd.mot.com
>
> Does the $1629 include your trade allowance?
> Does it include the extra filters you mention below?
> I assume you got this at HRO in Phoenix. Did you price it elsewhere?
> (I'm thinking about sales tax!)

$1629 is the current price being offered by HRO. No, I did not price it elsewhere (AES). The filters were another $200 which did bring the price up to $1800+. To be honest, with tax and everything the price was about $1950. I quoted $1629 because it was the dealer base price - which is (as usual), below the manufacturer's "list" price.

> So is the 1488/1489 all you get with the Kenwood computer interface option?

Yep. But it's packaged with connectors in a little interface box. (I haven't actually seen or used it.)

> Interesting. The ads just say 100 memories, not 100 per band. I'm surprised
> they don't mention that.

I should have stated it differently. There are 100 main memory channels. There is also band memory which returns you to the last VFO setting you used on each band. These are sometimes referred to as "band stacking" registers.

> How low can you go with the power?

On CW the lower limit is down around 10 watts or so. I don't know why it does not allow full 0-100 range. There are different low limits for each of the modes (I dont recall them, however).

>>   - Automatic Tuner with band memory
>
> Is this part of the standard radio?

It can be ordered without the auto tuner. The $1629 price includes the tuner. Subtract around $200 to order without the tuner.

>>   - 32 adjustable function setup procedure
>
> What sort of things does this procedure control?

Well, it's a long list, but some of the options are: UP/DOWN switch frequency step size, CW weighting options, transverter display options, RIT/XIT frequency range, Scan Hold option control, beep tone control for mode change beeps, FSK frequency shift amount, master/slave mode enable (for two 850's connected), PL tone selection, auto memory channel increment on store, etc.

>>   - Display can indicate transverter frequencies (144/220/450)
>>   This will be very nice, as soon as the transverters are

>>   available.
>
> Are they planned?

No info on this. Presumably existing transverters from other sources can be used. The IF OUT jack on the back can be set (using an internal jumper change) to provide RF DRIVE OUT for transverter operations.

>>   - DVR (option) stores cw and voice messages (3)
>>   I didn't buy the DVR but am thinking about it. There are 3 record
>>   and play buttons on the front panel for operating it.
>
> How many seconds of voice does it give you?
> Do you have the price for this option?

As I recall it's two 8 second messages and one 16 second message for a total of 32 seconds of message storage in 3 partitions. Cost is high, $200.

>
>>   - Comes with separate remote programming manual
>>   A nice manual covering all of the functions available on the
>>   serial control port.
>
> Tried it yet?

No, havent tried it but it looks straightforward (simple rs-232 commands).

>>   - Dual cascaded selectable IF filters (as with TS-950)
>>   Filtering is very good with this arrangement and I plopped down
>>   the extra $200 to get the pair of 500hz filters (I work a lot
>>   of much damned CW mode).
>
> Any reason you didn't go for the narrower ones?

There's only one other CW filter, the 270 HZ for the 8.33 mhz IF. I don't think its necessary especially in light of the fact that the 500 hz is further reducable using the slope tuning control. There's also a 1.8 Khz filter for SSB, but it must be plugged into the 270 hz board slot (kinda strange :). I had one of the 1.8 khz filters in my TS-440 and didn't use it at all. Again, since you can reduce the bandwith using the slope tuning control, I feel that the 1.8 khz is a waste of money. Also note that the 2.7 khz filters which come standard with the rig provide 2.4 khz of bandwidth when cascaded.

>>   - It comes with a microphone (same mic as the 440).
> Is this a desk or hand mic?

This is a simple hand mic with a pair of up/down buttons on it.

>>Also note that the 850 operates on 12 Volts!. The companion PS-52
>
> Current draw at full power?

```
Rated at 20 amps as I recall.

>
>>I only took the bottom cover off to install the filters but inside I saw
>
> Do the filters just plug in, or do they need to be soldered?

Yes, they plug in, they're the same filters as used in the TS-950
and TS-940.  Very easy to install.

------------------------------------------------------------

Next, I'll post a followup article on my first full weekend of operating.

-fred

>>   Would you mind a CBer using *your* callsign?  This could be fun, can I be
>> 9N1MM?   Can you identify using the call of a commercial radio station too?

>A ham call sign identifies the station, not the operator.

Is that true?  If you're a guest op you can use your own call from another
station, can't you? (I hope so, I've been doing it for more than 3 yrs now).
The call identifies the op in this case.  But we digress...

>In short using a ham call this way is needlessly risky.
>Why not use (for example) "Derek" as a CB handle ?
```

Oh gasp, I wasn't actually suggesting that I wanted to *do* this thing.
Far be it for me, an elitist know-coder etc..... I was just interested
in the possibilities - "needlessly risky" isn't the same thing as "illegal".
Could I actually get on CB and identify as G4NOC, for example? I don't
know - and I have to admit that I don't really care that much since things
haven't got so bad here that I am seriously contemplating doing it. From
what I've read on this net, far worse things happen on CB than this, and
nobody is about to do anything about them.

Mentioning guest operating in the previous post - does anyone know what the rules really are? Suppose I go on the first expedition to Albania in nearly 20 yrs, and work 50,000 hams around the world (all on CW, of course). Is there any way in which I can get credit for a QSO with ZA? (for the easily-excitable, I'm not actually thinking of doing this, OK?).

Logic says no, you can't have a QSO with Albania using your US call if you are in Tirana at the time. But I have also heard that you can "lend" your home station to someone who can operate it with your home call and thus give you a legal QSO with Albania. Is this true, and is it true in other countries?

In the case of someone who owns no radios at all, and simply guest operates with his own call, this presumably can't be done (so I won't be going to Albania after all).

It would look awfully suspicious if you were the QSL manager for your operation as well, and made a card out to yourself, assuming that this is legal.

What do you think, has Jim Smith got an A51JS card made out to himself?

Oh well, back to 'work' here...

Does anyone have a description of the satellites found in these bulletins?
Long name, objective/function, date of launch, owner, etc.?

Thanks

I actually read this book about ten years ago; there was a copy in my local library. The title was _Somebody Else Is On The Moon_. Lots of photos of lunar craters with strange tiny smudges in them which the author purported were huge machines being employed for some unknown purpose. He seemed to be asserting that some craters were being dug out like strip mines. There were also what seemed to be craters with partially closed lids on them and gears the size of Baltimore. The author seemed to genuinely believe what he was writing about, and was accusing the U.S. government of a cover-up, but even to my 12-year-old (at the time) mind, most of these strange "artifacts" could be explained away as the result of tricks of the light plus overactive imagination.

More info on the Kenwood TS-850S - After The First Weekend

THE RECEIVER

Overall I'd have to say that the receiver is first rate. Although most of my personal experience comes from the TS-440, I have used a few other brands from time to time and I can recall none which seem to be noticeably better in any way. It's receive sensitivity (1.8 to 30 Mhz) is quoted as less than .2 microvolts. With its 108 db Intermodulation Dynamic Range (IMD), it stacks up very well against many of the other top rigs on the market. For example, the Kenwood TS-950 is advertised at only 105 db IMD and the Yaesu FT-1000 is the same at 108 db IMD. And yet, both of these rigs are in the $3500 price class.

I realize that there is more to a receiver than IMD, and I am just as eager as the next person to see a thorough review of the radio by the ARRL Laboratory. Don't look for it, however, until late in the year at best, given the Lab's typical backlog.

I've received some inquires about its AM Broadcast reception cababilities. First let me state that I've not been a particularly avid SWL'r and so I can't really compare it to anything. About all I have to say is that it seems to be quite accurate on broadcast frequencies and that you can choose any filter combination including 12 kHz 6 kHz, 2.7 kHz, 500 Hz and 270 Hz while in AM. There's no mention of any optional 6 kHz AM filters available. I'm not sure as to whether the included 6 kHz filters are crystal or ceramic.

ON RTTY AND OTHER AFSK MODES...

As one may expect, there have been some, shall we say, "surprises" which were initially confusing. The first one concerns the use of the rig with RTTY/AMTOR and Packet. It's always nice to employ all of the crystal selectivity you can muster when in these modes. In the radio's FSK mode, I select both of the 500 Hz filters and the copy is just fine. In the FSK mode, the rig properly, and automatically, shifts the IF passband center up by 2125 Hz so that the received tones (which are 170 Hz apart) fall right into the middle of the 500 Hz filters giving a clean and reliable copy.

Ok, so the RTTY receive is great. My problem (and I suspect that I'm not alone) is that my multimode TNC (the MFJ 1278) does AFSK and not FSK. Since the TS-850's FSK mode is true direct frequency shift keying (with digitally adjustable shift widths), it is expecting a keying relay to be diddling the RTTY IN port on the back of the rig. Alas, my TNC does not do direct keying and therefore there is no way to input its audio tones into the radio when the rig is in the FSK mode. Now here's where I would suggest to Kenwood that they could have added another option. They could have constructed a setup option which allowed the user to define the FSK mode to be direct keying or AFSK. Oh well....

So why not just use lower sideband just like everybody else for the AFSK modes? Well, the reason is that in LSB (or USB), the IF passband center is not shifted up as it is in the FSK mode and the transmitted tones (which are about 2.1 Khz offset) now fall outside of the 500 Hz filters passband making successful copy impossible. I can just use the cascaded 2.7 kHz filters (which when used together yield a 2.4 kHz response), but that's not why I invested a couple of hundred bucks in custom quartz. Suddenly a bit of disappointment sets in....

After sleeping on this one I realized that it must be possible to set the radio to receive on FSK and transmit on LSB. Sure enough, it works just fine - chalk up another point for operating flexibility. Flexibility yes but ease of use.. well, not exactly. To use this mode you must set the LSB transmit frequency as an offset of the FSK receive frequency (+- 2295 Hz depending on USB/LSB). This works but is a pain in practice since you either have to tune to an existing signal first in LSB and then switch to FSK and calculate the offset. Otherwise, you just calculate the offset and begin transmitting.

After some trial and error I discovered that I could get excellent AFSK receive performance by combining one of the 500 Hz filters (the 8.33 MHz) and one of the 2.7 kHz (the 455 kHz) of the receiver IF. After doing this, it is also necessary to set the Low Cut control on the Slope Tuning control to about the halfway position. This seems to yield pretty decent overall performance. After having discovered this I was able to hold on to a lengthy AMTOR QSO which I was receiving at no more than S-1 on the meter scale.

SLOPE TUNING?

The action of the Slope Tuning control in the above example is somewhat curious. Overall, I've not discovered the true mechanics behind the slope tuning control but in lieu of the yet-to-be-released service manual, I have developed a hypothesis which I'd like to share with you.

The Slope Tuning control consists of two concentric knobs, one labeled HI CUT and the other LOW CUT. When the LOW CUT knob is fully counter clockwise and the HI CUT knob is fully clockwise, maximum IF bandwidth (up to the selected filter bandwidth) is selected. This scheme is common on many other Kenwood rigs dating back to the TS-830.

The LOW CUT control is supposed to move the lower part of the passband edge closer to the center (carrier) frequency and the HIGH CUT control is supposed do the opposite to the high edge. One thing that I've noticed, however, is that the LOW CUT seems to be most affected by the 8.33 MHz filter selection and that the HI cut is more affected by the 455 kHz filter selection. I would not have expected any relationship between these things.

My TS-440 had the traditional IF SHIFT control in lieu of a Slope Tuning control. In combination with the multisegment LED bar graph display on my TNC, I could observe the affect that the IF SHIFT had on the RTTY tuning - it coincided. When I shifted the IF up and down, the indicator LED would move up or down accordingly.

Getting back to the TS-850, I've noticed that when the filter combination I mentioned above (500 Hz on 8.33 and 2.7 kHz on 455) is used, I see nearly the exact same TNC bargraph LED action when using the 850's LOW CUT control. This leads me to speculate that LOW CUT control is actually an IF SHIFT for the 8.33 MHz IF and the HI CUT control is the same for the 455 kHz IF. Increasing the LOW CUT (turning the knob to the right) shifts the 8.33 MHz IF to the right and increasing the HIGH CUT (turning the knob to the left) shifts the 455 kHz IF to the left. The two passbands combine giving the effect of independently adjustable high and low passband edges.

I wish to emphasize that the above IF and filter interaction theory is just that, a *theory* and I welcome any comments from the readership who can perhaps lend a different or more accurate perspective of this behavior.

PL TONES

I wanted to mention the PL operation because I find it to be just a little strange. Please bear in mind that the need for this function ranges from extremely limited to practically nil. I, for one, have never cared too much for 10 meter repeater operation and when I have used it no PL was required anyway. Nonetheless, I'll concede that some of you may indeed have a use for HF PL tones.

The point about the PL tones in this radio is that there is no TONE ON/OFF control anywhere that I can determine. You can select both the tone and it's mode (either Burst or Continuous) using the 32 function setup menu, but there is no explicit ON/OFF for tone.
I read the manual cover-to-cover a couple of times before I finally found the answer, which like most of the manual is a "hard" (literal) translation of the Japanese original. Paraphrasing the section, it states in the manual under "REPEATER OPERATION" that "tones are selected automatically whenever the FM mode is in effect and split operations are being used". What this means is that whenever you are working FM split, you're using PL, period. It looks like the best you can do to minimize this is to select the PL Burst option as I mentioned above.

CONCLUSION

I've sent Kenwood some E-mail via their BBS number (1-212-761-8284) asking about the FSK vs. AFSK problem which I described above. This was on Friday and so far today I've not been able to log back onto their system to see if they have any response for me. I'll be sure and post one if it comes and I'll call them by voice if one doesn't.

I hope that those of you who have stuck with my two articles this far have found them interesting and/or informative. Thanks to all of you who have sent me e-mail regarding the article(s). I'll be happy to answer any further questions either on the alias or via private e-mail as my work schedule permits.

Also, some folks have asked me to post the specific selectivity figures from the manual. I will post these the next chance I get.

As I mentioned earlier in this thread, Utah ARES and RACES is using the Anderson Power-Pole connectors. I guess I neglected to mention that these cannot be plugged in backwards (+ to - etc.). You do however have to have the colors put together the same in order for this to be true.

We use the 30Amp version. You order them as three separate pieces. Two plastic shells, and the metal connector inserts for them. When you get them in your hands, hold the two shells such that you are looking into the throat of them. If you have this right, you should see a tiny "A" on the front of each shell. Hold them such that the "A" is right side up, then put the RED shell on the RIGHT. Glue the two shells together. Again, hold them so that you see the two little "A"'s right side up with the RED shell on the RIGHT.

We have found that even though you can crimp the inserts to the wire, it is better to solder them (before putting the inserts into the shells). They are tinned and solder very easily.

We have also found that it is most convienient to put two connections on each piece for equipment. This allows you to daisy-chain various pieces of equipment together.

The only disadvantage to these connectors that we have found is that a source can be plugged into another source. This is usually not a problem, and can be a big ADVANTAGE. This allows me to plug my deep cycle RV battery into my regulated power supply to float/charge it. I can also quick charge my large (5-10 Amp hour) ni-cad packs the same way. You just have to be a little careful. We have used these connectors across the state for several years now and I have not heard of any major problems.

Thanks,
Keith McQueen
ARES EC Utah County
Utah County SCAT team commander

You are right. Icom is going to introduce a new dual band HT.
I have a Japanese friend who is a visiting scientist in my lab and is a ham. One day he showed me a Japanese CQ buyers guide
and I found this unit
- IC-W2. The list price is 64,000 yen. Divided by 140, you will get the list price in US dollars. In my opinion, this will be nothing but the same as IC-24 or other HTs and I think all of the HTs are the same -- poor antenna efficiency and low power. I have an ICOM IC2-GAT 7W output and for the poor antenna efficiency I can hardly make any contact without using other antenna and a linear to boost up the receiving/transmitting signal.

The two best sources for foreign return postage are:

George Robertson, W2AZX
DX Stamp Service
7661 Roder Parkway
Ontario NY 14519

Brian Treadwell, WV4V
DX QSL Associates
434 Blair Rd NW
Vienna, VA 22180

Send either an SASE for their current price lists. Roughly $1-$1.40 per stamp. Actually, you'll usually get a little packet of several stamps. Use them all - ie, one packet = sufficient airmail postage for one normal letter. I've had excellent service from both. Tell them I sent you.

Other hints: Expect high ripoff rates in many Caribbean countries, South America, and the USSR. The postal service in these places will 'fail to delever' anything that looks like it contains stamps or money. Never put call signs on envelopes (but unless the PO is totally lame, they *know* the reciepient is a ham anyway.) Never send anything besides a card to Box 88, Moscow -- the Central Radio Club considers any enclosures to be 'donations'.

Brian has Euro style airmail envelopes for sale, which he imports from Switzerland. I like to use them for both ways. They make incoming letters look much more like correspondence than like QSL cards. They are also big enough for those oversized (ie, std metric sized) QSL cards. I *hate* it when they fold a QSL to fit a US envelope. Only problem is cost. Does anybody know of a source of Euro-stype airmail envelopes that aren't $0.25 each???

73 and good DX /Chris (AA6SQ)

>c. There weren't any flux-gate compasses used in WWII.

WRONG WRONG WRONG. I have one!! It was the main nav compass for a B17.
I purchased mine from one of the surplus places about 5 years ago.
There was an article several years ago in one or the electronics mags about
how to play with these. I believe it was in the hardware hackers column.

I have not managed to make my WWII flux gate work, for several reasons.
 1) lack of doumentation.
 2) lack of the electronic section, I have the flux gate and the indicator.
 3) Its a three phase system, all new systems are two phase.
    I believe they used a three phase system, because all they had for
    indicators were syncro motors.

Out of band? 420.005 MHz is in band, unless you're north of "Line A" or
in one of two or three specific cities. Sure, the 70 cm equipment makers
don't seem to know this, and some equipment reviewers who write for some
of the ham mags don't know it, but them's the rules...

Lines: 51

What do I want in a radio? well, here goes:

1) Understandable circuit constructed using as many off-the-shelf parts as possible. Surface-mounted chips may be a plus-point for the manufacturer when he assembles the thing, but they are a pig of a job to change in the average ham workshop. And where do i get a new PAL chip to fix my dead Kencomsu TX9900 at 4:30PM on a saturday? Certainly not from the local Radio Shack; ('Sorry sir, if its not in the catalog it dont exist').
2) Plenty of space inside to allow me to fit internal modifications, try out new demodulators, filters etc. and to repair the thing when it dies.
3) Full schematics and alignment instructions to be supplied, ideally with voltage readings on critical points etc. (if these are not supplied, then no worry - an hour with the DVM to establish the 'when working' voltages is time well spent when the thing dies in 5 years time).
4) For HF gear, an analog VFO and a nice heavy flywheel on the tuning knob. The 'feel' of a control is just as important as how well it works.
5) For VHF gear (FM) a few channels accessible by a simple rotary switch.

Try programming 145.5625MHz when wearing gloves at 3AM in the dark on some of the modern micro-hand-helds and you will see what i mean.

6) Able to operate into any (or no!) RF load without damage. Power output to degrade 'gracefully' with increasing SWR. (the 'sudden death above 2:1' type of SWR protection makes it almost impossible to use the radio when experimenting with antennas, using radio as temporary RF-dielectric-heater etc)
7) Freedom from crossmodulation/desense - most important when operating on more than one band at the same time.
8) Robust construction so i do not have to worry about the radio suffering mechanical damage when portable/mobile. 'Robust' to me implies a steel case/chassis, and proper 1/4-inch-shaft controls. Make it *HEAVY*.
9) Proper design - able to operate continuous duty without overheating; (this means using tubes etc. run at 'continuous commercial service' ratings, not 'Intermittent commercial & amateur service' ratings - likewise for solidstate PA's.) How many modern '100-watt' radios have to reduce to, say, 25 watts for AM operation? To me, this says these are '25 watt' radios.

I am prepared to do without memories, scanning, LCD readouts of the designer's star-sign, microphone-controlled up/down tuning, extended frequency coverage, computer control, speech-indication of frequency, digital voice storage, built in keyers, real-time dollar/yen conversion, and all the other stuff that seems to be included nowadays.

At times, looking at some of the modern gear, it looks to me more like 'a computer that just happens to be able to transmit' rather than a radio.

Now if someone were to start selling kits to build-your-own KWM-2A and charging, say, 1500 dollars for the parts, I would buy one rather than fork out the same cash on the products of any of the top three brands from the Orient. Most of the equipment i use is/was designed for the 'commercial' market rather than the 'amateur' market. I would rather buy a 10-year-old Mercedes than a new Subaru.

The previous posting tells how to find a test session
on the West Coast.

Fear not, if you
are in the East you still can get a license (or try the
test anyhow) with or without code.

Just call (215) 946-1040 or (215) 736-3333 and set a schedule.

It's easy. The more the better. We want new hams. New-tech,
old-tech, Novice, whatever.

I'm looking at building a receiver that is in the 1991 ARRL Handbook.
I think I understand everything that is identified in the schematics
and text, but I'm a little confused on the demodulation circuit. The
receiver is currently designed to support CW, USB, and LSB, but I would
also like to include AM so I can use it for SW reception as well as
future ham use. It would appear that all I need to do is add an additional
BFO circuit that I switch in, but after going through the book a couple
of times I'm having a hard time finding a circuit to help me with this.

Can someone point me in the right direction in terms of references?

Thanks in advance for any help. My apologies if this is a simple question
but my brain is really rusty on this non-digital stuff.

Your problem is you don't work enough CW!!! Just start up a nice QSO on the low end of 10 Meters and within moments your front end will overload with all of the CB hookers transmitting illegally on the band. The problem is I haven't found one yet that can copy 35 WPM. Oh well, it's got to be that damn no-code..

Many many B-) 's AA6PN

Hamfolks:

Enormous overjoyment--my wife got her technician license and is taking the
General code this weekend (listen for N8NFE, Laura) and we got a pair of
HTs which she seems to enjoy enormously. We bought TH77As, which I can
recommend except for those little dummy-load antennas shipped with them.

Anyone know the mod for aircraft band AM? The Kenwood ads say its possible,
but there's nothing in the manual about it.

Any other mods known?

Thanks!

73,

David, AD8Y

a. The company's name is Jerryco.
b. They don't have any flux-gate compasses in their last few catalogues.
c. There weren't any flux-gate compasses used in WWII.

You asked and here it is!

These dimensions are from the 2M/220 Mhz dual band J pole I built in
1984 when I got my 220 rig. It took me only a few hours and 10 feet of
1/2 inch cooper tubing (I had some left over for a 440 as well).
39.5 inches to the first 'T'
13.25 inches 220 MHz stub
 1.75 inches from tuning stub to 'T'

19.5 inches from first 'T' to second 'T'
19   inches 2M tuning stub
 2.25 inches from stub to 'T'
other hardware I used:
 2 'T's, 2 90 degree elbows and 3 end caps
7 feet of cooper tubing would do it if you are crunched for
resources.

```
         -----
              |
--------------+-------------+--
                ____________|
```

This is a rough idea of what mine looks like. I made the tuning
stubs 180 degrees from each other. All of the measurements are
approximate to the nearest 1/4 inch. I used a 3/8 inch rod to
support the whole array. I fed it with RG-58 coax and did not use
a balun. If I had a rig for 440 I would have included that bthis antenna
(donations of 440 rigs will be accepted).
 I hope I made this clear enough, drop me a note if you found this
of use. 73 LARRY

Wasn't there an article in one of the pop. press magazines (maybe Radio
Electronics) about six months ago on how to interface to the Rat Shack
flux gate compass> The RS unit is intended as a standalone automotive
compass but the main element is a reasonable flux-gate magnetic heading
sensor.

Note that in addition to sensor inaccuracies, you will have to cope with
the magnetic declination - the differnece between magnetic and
geographic north - that varies from one location to another.

Please check out the Radio Society of Great Britain's RADIO COMMUNICATIONS HANDBOOK, 2 volumes. It has by far the best coverage of home radio construction projects of any of the popular ham radio handbooks. The Bill Orr RADIO HANDBOOK, published by the Editors and Engineers subsidiary of Sams. comes second. The ARRL Handbook is, sadly, a waste of time for the sort of thing you have in mind.

OK, someone (AMSAT?) what is the definitive word on what frequency U2MIR is going to be using?? So far people have been claiming to have heard him on everything from DC to LIGHT. Where exactly should I be listening?? I didn't get to work the Shuttle, but I would gladly settle for MIR.

I can tell you from personal experience that the code has been a deterrent to otherwise technical people to get into amateur radio. A few months back, a friend and I went ahead and passed the written tests all the way up to and including advanced (w/ perfect scores on 2 out of the 3 I might add (;-)

We have since stalled on the code (mainly because of a lack of time... or perhaps its psychological (:-). Our intent was to use the license purely for packet radio use. We are both sufficiently versed in general datacomm issues and have access to extensive computer resources at work and at home.

Now we WILL finish off the code test. But who knows how long that will take and in the meantime many many others are staying away from getting into packet radio because of the code requirement. I personally think it's one of those things that might come handy in life (sort of like knowing how to start a fire without a match, etc...) but one that is absolutely of no relevance to data communications (I never bothered to memorize EBCDIC codes. There are a lot of IBM machines out there but I don't usually come into contact with them. And when I do, there is a conversion program that takes care of things...)

I think a codeless license would increase the number of interested parties. Even more valuable though would be a packet class license (with its own identifier to set it apart from general CW) for those without any intention of going voice or code. You would get an incredible increase in R&D and experimental networking (especially in the area of Wide Area networking and distributed networks) if that comes to be. Not many people have access to satellite and leased lines for network research.

Anyone with a PC, a TNC, and a willing friend can come up with amazing distributed network facilities.

Just my two cents worth...

Cheers,

|ATTENTION:
|
| A significant surge of solar activity has begun. Two very significant
|and very large active regions have developed and are now capable of spawning
|major energetic flare activity. In addition, significant activity has been
|observed on the eastern limb. Loops and an associated flare was observed
|near S14E90 today. The solar flux has exploded to a value of 244 and is
|expected to rise perhaps in excess of 260 by the time the peak is reached.
|The sunspot number has likewise experienced a dramatic increase and is now
|reported at a value of 216 (although it will likely climb quite higher
|as the eastern limb region(s) rotate into view).

I am new to this newsgroup. What harm/benefit does a solar flare bring?

>traditional way, but not the only way.

One thing I have found to be true since using a PK-232 to copy code is that it is the best way to improve code reception by ear. In fact I'm so impressed with the results of watching the screen display while listening to the audio code that I would say that this technique is a major breakthrough for those trying to improve their code speed. There is an unconcious connection made between the words coming out on the screen and the sound of the word in CW that trains the ear rapidly to make the same association when later one justs listens to the code without the screen. Try listening to the ARRL bulletins and code practice sessions while looking at the words on the screen. I was amazed at the results.

It also does one thing that I think is very exciting. It opens the door to activity on the CW bands to those who cannot yet copy the majority of QSO's going on. Anyone with a PK-232 or similar TNC can jump right in and enjoy what is happening on the CW bands while at the same time training their ear for higher and higher speeds. If they use a keyboard, they can jump right in and become an instant CW OP. Sound strange coming from an OF key banger? Not really By getting on the air any way they can they will be getting involved in what is happening on the CW bands, meeting some of the great, friendly people that hang around there and at the same time constanly raising their code speed painlessly while having fun at the same time. I don't look at code reading TNC's as a crutch but, rather, as excellent training machines. If the end result is another OP who feels as much at ease on CW as any of the many other modes, the machine has done its job. Whether you use a key or a keyboard, you are on the air improving your operating skills and having a good time.

Inevitably the lure of sending effortless code with a beautiful chrome Bencher key will seize the poor sucker by the throat and a new addict to the outmoded mode will be born....B-) B-) B-)

[I have set the followup-to header to rec.ham-radio]

[Um, if you're not in the Bay Area, you should check with your local hams and or electronics stores to find out information on testing]

Summary:

Yes, as of 14 February 1991, you can now get an amateur [ham] radio license without having to learn Morse code!

Take your test[s] now, avoid the rush. Easier than the SAT.

Cost for the test is $5.25 Cost for study materials ranges from $0.00 [if you get the "ham stacks" off of apple.com and have a mac] to somewhere in the neighborhood of $16.00

Details:

The ARRL [Amateur Radio Relay League] petitioned the FCC [Federal Communications Commission] in 1989 for a new class [a modified Technician] of license ham license, to be dubbed the "Communicator". The FCC decided to remove the 5WPM Morse code from the current Technician license and restrict Novice HF ["high frequency" - to you and I, shortwave] privileges to only those people who have passed a 5WPM exam. [The FCC calls it "Element 1A".]

So, what do you get?
    Full privileges on all the VHF, UHF and microwave ham bands above 30MHz.

What does this mean?
    International communication on the 6m band when conditions are right.
    Local communications on the popular 2m and 440MHz bands.
    More local communications on the other UHF bands.
    Satellite communications. Satellite "voice mail" is apparently coming soon - leave your message when it's over you and your friend on the other side of the planet can pick it up when

it's over her. Use an amateur satellite as a "repeater".
Talk to the hams on the Mir space station! [There appears to be at least one ham on Mir all the time these days.]
Talk to the hams when they fly on the space shuttle.
Bounce your signals off of the moon for long-range conversations.
Use a large temperature inversion to your advantage.
Packet radio [TCP/IP] at various speeds [mostly slow right now, but it will get faster]
Use "repeaters" to extand your working range. If you're in the Bay Area and are patient enough, you can set up links from Baja California to British Columbia.

What do you have to do?

Pass two exams - Elements 2 and 3a. The Novice written exam [Element 2] is 30 multiple-choice questions taken from a pool of about 350 questions. The Technician written exam [Element 3a] consists of 25 questions out of a pool of about 250 questions. You need to get a score of 73% or better in order to pass. The Novice exam costs nothing to take and if you want to take any more exams, it costs $5.25 per testing session [take as many tests as you like, so long as you do them in order and keep passing].

How do you learn the material?

Buy a book -- the ARRL publishes license manuals that run about $8 each. Or, if you can't find the license manuals [Ham Radio Outlet in Oakland or Burlingame, almost any electronics parts shop, maybe even Cody's or Stacy's] in a regular store, you can go to any Radio Shack and buy their license manuals, which are maybe even better [for your purpose] than the ARRL manuals. Make sure that you get a book that is still valid - it should say something like "Material good until <some date>" on the cover.

Study the tests. The book may say "Don't start here", but why not? Your objective at the moment is to learn the material that will be presented on the exam and the correct answers. There are some trick questions - you want to learn those. Some questions will have obvious answers - this is good as it means you don't have to stuff those answers into your memory. Play with the ham stacks if you have a macintosh [if you have a PC clone, you can get practice test software from SIMTEL]. Practice practice practice until you have it down pat.

Find a testing center. Phone (408) 255-9000 for the Sunnyvale VEC which gives you locations and contact phone numbers for when and where you can take your exams. Phone (408) 984-8353 for the ARRL VEC.

When can you take your test? Well, definitely on 14 February you can get everything done in one day by going to the Sunnyvale VEC's special exam date. The ARRL VEC, in Cupertino, will let you take your tests now [well, first Saturday of February] and hold your "Form 610" [your license application to the FCC] until the 14th and then send it in. If you find a VEC that won't send in your form 610 right now, take elements 2 and 3a anyway - they'll give you a CSCE form that says that you passed those two elements and it's good for a year. Then, you can take your CSCE to someone on or after the 14th and they will have you fill out a form 610 which will be sent to the FCC.

Then what?

Wait 4-6 weeks for the FCC to process your form and STUDY THE BOOKS! You want to know what the proper procedures are - this is not CB radio where anything goes. As you'll find out on your exam, there are strict rules and good practices to be followed, sort of like when you join a mailing list.

If you need more information, please don't hesitate to call me. I may not be an expert, I may not even be licensed yet [passed my two exams this past Saturday], but I have what I hope is good information.

GOOD LUCK!

Message-ID: <9540@jjmhome.UUCP>
Date: 25 Jan 91 21:00:56 GMT
Lines: 8

I'll be visiting Hawaii at the end of February on a business trip and I'd like to visit some of the locals and get some operating time in. Does anyone know any hams on Hawaii (preferably near Hilo but it doesn't matter) with HF capability who I might be able to visit?

I don't think any random listener knows who it is. I do know that
when you're scanning around the short waves in Israel you pick up
that numbers lady all day and all night, starting every 15 minutes,
sometimes on as many as ten different frequencies (I did this during
the spring of '90). You also pick up a handful of other numbers
ladies, but this one that people call the Mossad lady seems most
prevalent.

At the risk of seeming ungrateful, I realize that publishing this thing is a royal pain, I am turning on the flame thrower for a bit.

I received a duplicate of Info-Ham 109. The headers of the two messages follow. I frequently receive duplicate messages in two sequential Info-Hams.

My account is billed about $50.00 dollars a month for Info-Hams. fortunately it is not real money, we are charged a minimum annual fee for the main frame and we don't use it all. I resent spending my time reading sexist remarks and Radio Shack bashing. I resent even more paying for it even with funny money. I also don't like technical stuff being cut out and only the header left. If the technical stuff is going to be cut, cut the header too or better yet send it to me and I'll collect it and post some where where us techy types can get it and not have to interrupt these serious flaming sessions.

Many of us need to be more conscious that some one some where is paying for our toy. If there are 1000 subscribers to this the billing would come to a half million a year. I realize that in a world where it cost 600 million a day to fight a war and were bailing out S&L's at a billion or two ahead the cost of Info-Hams isn't very much. I know that that the real cost is far less than than what I am billed but it still cost some amount per pound to ship this crap.

!! Flames off !!

Even though I had to explain to one of my bosses why his computer account was over drawn, Info-Hams is worth it to me. I find it a valuable resource for information. Any request for help generally returns a number of very helpful letters. It is the best research tool I have found for electronics related Information. I would like to find more news groups related to electronics, the C computer language and agriculture. I might even consider moderating one related to agriculture or 68HC11 computers.

My shields are up and my asbestos underwear is on. Your Shot.

```
 |     Does anyone know of a case(s) where someone was injured while using
 |a vacuum tube amplifier?
    ^^^^^^^^^^^^^^^^^^^^^^
```

If high power amplifiers in broadcast or ham radio stations are included, sure enough, there have been many injured and dead, as the plate voltages are ranging from KV to 10 KV. I heard the engineer at the radio station in Saipan Is. was dead about ten years ago by the accident.

I had built several high power amplifiers for ham radio and lab experiments in my school days. Fortunately I am still alive. But I will use Power MOS FETs next time as they need only 150 V to make KW.

As for audio amplifiers and radio receivers, the plate voltages are usually hundreds volts and not so fatal unless your hands are wet or sweat.

Anyway, be careful !

Try using FM on carrier current (aka: Pipe it into the AC lines!) that will
rpobably meet the reuqirement and still have decent signal throughout the
building...

NO, you turn OFF the BFO for AM reception........and turn it on for carrier
```

reinsertion for SSB and CW reception.....Try that and see if it works..I dont
have the 91 handbook to look at the schematic...

They greatly affect radio wave propagation by ionospheric refraction. Under some circumstances they can shut shortwave propagation down totally. I can recall one extreme case a dozen years ago in which propagation on the amateur 75 meter band was 'line of sight' just like UHF. I was running 1 kw and could not be heard more than about 10 miles. Within that range I was very loud. Paradoxically, I 'got out' farther running 10 watts on two meters.

-- MAJOR SOLAR FLARE ALERT --

JANUARY 25, 1991

Flare Event Summary
Potential Impact Forecast

MAJOR ENERGETIC EVENT SUMMARY

A very powerful major energetic event ripped off the eastern limb of the sun on 25 January. The flare, rated a powerful class X10.8/SF flare began at 06:23 UT on 25 January. It peaked at an x-ray level of X10.8 at 06:35 UT and held at an X10 level for 17 minutes. This event ended at 09:51 (a long duration event). The flare was associated with strong Type II and Type IV sweep frequency events and was also associated with strong radio emissions. A burst of 57,000 s.f.u. was observed at 245 MHz. The burst at 10 cm was 3,500 s.f.u. The location of this flare was S16E78.

The region responsible for this exceedingly powerful event is Region 6471 (near S13E61). This region is very complex and is large in area.

Magnetic gradients in this regon are also high. Major flaring from this region is likely. The potential impacts of this flare are stated below.

In addition to Region 6471, Regions 6466 and 6462 (now nearing the central meridian) also retain very complex parameters and high magnetic gradients. Any of these three regions could produce major energetic flares which could include proton flares. The probability for further X-class and/or proton flares from these regions has been increased, particularly with the appearance of Region 6471 on the east limb. The solar flux has responded to the enormous jump in activity and is now recorded at a level of 283. The background x-ray flux has jumped to levels in excess of class C2.0. The sunspot number has likewise jumped and is now estimated at a value between 240 to 260 (observations are not yet all in).

The regions now on the disk represent a very serious increase in solar activity. The risk for major flaring, proton flaring, satellite proton activity and Polar Cap Absorption activity is high. The Space Environment Services Center is maintaining a condition YELLOW alert status for possible PCA activity. This recent flare did not produce any significant increases in solar protons, but the position of this flare was too far east for solar protons to seriously impact with the earth. As Region 6471 approaches the central meridian, and as Regions 6466 and 6462 move into the western hemisphere, the risk for proton bombardments will increase.

POTENTIAL TERRESTRIAL IMPACT FORECAST

The recent class X10.8/SF major flare is expected to produce a low to moderate impact with the earth sometime on 28 January. It will likely only produce active conditions, but many area's could experience minor storming. The long duration minor flare of 24 January is expected to produce some increased activity today or possibly into tommorrow. There are conflicting reports that the activity from this minor flare may have already impacted with the earth. However, at the present time, we still believe the shock (if one does indeed materialize) is still on its way and should reach the earth sometime today or early tommorrow (27 January), UT time.

There is a chance that a shock from the class X10.8 flare may not have an impact with the earth. This flare occurred relatively far away on the eastern limb, and hence the probability for terrestrial impacts is much lower than it would be if the flare would have occurred nearer to the central meridian. But it's association with strong Type II and IV sweeps is indicative of a coronal mass ejection which could have an impact with the earth, depending on the trajectory of the plasma cloud.

People should be on the alert for potential increases in geomagnetic activity over the next 24 hours, and again late on 27 January through to about 29 January. Impacts shouldn't be too strong (unless some other powerful flare occurs from Regions 6466 or 6462), but middle latitude minor storming is a possibility.

Major flares are still possible (if not likely) over the next 24 to 48 hours. Proton flaring is possible, as is potential PCA activity. Radio

communications may experience significant long-duration fadeouts on HF bands if major flares occur. Affected area's will be restricted to the sunlit hemisphere, and will include mostly the low and middle latitudes.
SID's/SWF's of more minor intensity are also expected as M-class flaring increases. Night-time propagation should be mostly normal if effects from the minor M-class flare of 24 January do not materialize or are smaller than expected. Propagation on 28 January is expected to become somewhat degraded.
VHF propagation via D-layer reflection is possible during periods of major flaring. Also, the MUF has increased over the past 48 to 72 hours and may provide some openings on 6 meters.

Watch for possible future major flare alerts and/or possible geomagnetic storm alerts.

I've almost settled on purchasing the Yaesu FT-470, but have heard many people mention the Kenwood TH-77A. Could someone please review the advantages/disadvantages of these two models for me? I have info. on the 470 from some people. What I would like is for someone to say something like "The FT-470 can do...','but the Th-77A can only go as far as...'. 'The TH-77A can do...', but the FT-470 can only do...'" Know what I mean? Something like a side-to-side showdown of the two.

Thanks much for any info. relating to these two models that anyone can provide. Please don't forget current prices (i.e. How much stores are selling the models for).

I question the accuracy of the external add-on digital readouts available on the market. Although they may display many digits, they cannot be accurate unless they measure the frequency of ALL oscillators within the receiver, and then combine them to calculate the received frequency.
If they just measure the variable oscillator and assume that the crystal-controlled oscillators are on frequency, they can be off by several khz.
Of course one may be able to "adjust" the readout to compensate for this, but then it has to be redone for each band and is hence no better than recalibrating the analog dial each time.
I'd be interested to know how the various models available actually deal with this problem.

A related problem for ALL digital displays is what does the displayed frequency really mean for a cw signal? Is it correct when the beat note is tuned to zero? If so, its not very useful since you can't hear the signal then. To be correct, it should take into account the bfo frequency and the center frequency of the filter being used. Do any displays do that?
Since most receivers with digital displays do not have crystal calibrators, there is no simple way to answer this question without an external signal source of known frequency.

******************** MILITARY RADIO OPERATIONS ********************

I'm passing this along to the Amateur Operators here on the echo. There has been a rash of patriotic amateurs operating on the military frequencies and on the MARS frequencies. Although the intention of the amateurs on the frequencies are good, their activites on these frequencies are prohibited.

****

On CNN, there was an operator from NYC operating on 11.176MHz using his amateur call, contacting a MAC flight headed to the war zone.

****

Please keep from transmitting on the military and MARS frequencies as it interfers with operations.

****

The other day we had an amateur asking for a signal report on a MARS phone patch frequency, while a patch was in progress. He was more than 50KHz out of band and caused some confusion between the serviceman and his family. Put yourself in the serviceman's shoes and how you would view the situation.

****

If you know of anyone doing this, please ask them to listen only. You can SWL all you want, just refrain from keying up, please.

****

If you are interested in helping, contact the MARS operators in your area and take the training for your certificate.

Thanks for your time. KB4YLY / AFA2GN

It's not that I forgot anything... as I stated in the artile, I had only owned the thing for a few hours before I wrote the article. Not what I've spent some time on it, I can say that it definately receives better than the 440. I can't tell you about phase noise, because I'm not in a position to measure it. I'll leave that up to the ARRL labs... My overall impression is that it sounds wonderful! The filters are really nice and the slope tuning is fully functional to the point where I don't miss the lack of an IF shift or PBT at all.

BTW, I'll bet you're not a Kenwood person (HI, just kidding, I wouldn't want to start a brand name war here :-).

```

and if your system had anything to detect duplicates, it could have detected them. Any system which bills you for INCOMING mail definitely SHOULD have such a detection system, with message-ids queued for 3 days at least.

>My account is billed about $50.00 dollars a month for Info-Hams.
>fortunately it is not real money, we are charged a minimum annual
>fee for the main frame and we don't use it all. I resent
>spending my time reading sexist remarks and Radio Shack bashing.
>I resent even more paying for it even with funny money. I also
>don't like technical stuff being cut out and only the header
>left. If the technical stuff is going to be cut, cut the header
>too or better yet send it to me and I'll collect it and post some
>where where us techy types can get it and not have to interrupt
>these serious flaming sessions.

I agree that there is a high noise level on the group, but where do you draw the line that will satsify all, considering that most people do not have the "incoming billing" problems.

>Many of us need to be more conscious that some one some where is
>paying for our toy. If there are 1000 subscribers to this the
>billing would come to a half million a year. I realize that in a
>world where it cost 600 million a day to fight a war and were
>bailing out S&L's at a billion or two ahead the cost of Info-Hams
>isn't very much. I know that that the real cost is far less than
>than what I am billed but it still cost some amount per pound to
>ship this crap.

But when one has something to say and a means to say it, they say it.

It might be better if people had to PAY TO POST. Freedom of speech
does not mean speech is free of cost, just free of legal prohibitions
(IMHO).

>Even though I had to explain to one of my bosses why his computer
>account was over drawn, Info-Hams is worth it to me. I
>find it a valuable resource for information. Any request for help
>generally returns a number of very helpful letters. It is the
>best research tool I have found for electronics related
>Information. I would like to find more news groups related to
>electronics, the C computer language and agriculture. I might even
>consider moderating one related to agriculture or 68HC11
>computers.

I would recommend you get on USENET and cease the INFO-HAMS mail. That
way you can read things you want and ignore what you don't care about.

Yes, there have been many fatalities from contact with B+ voltages in
tube-type amplifiers over the years, some of them well-known and
experienced hams.  As a pilot friend of mine says, "there are some
accidents you don't learn from ..."

I've tried frequently here in Washington, but have heard only the
'bubble jammer' signal.  I understand their hours have been curtailed.

While it's true there is some tcp/ip out there (Hurrah!) the vast majority
of packet traffic is AX.25 virtual-circuit-oriented OSI-influenced bilge.
And most of the tcp/ip traffic is encapsulated in AX.25 frames.  Sigh.

However, RUN don't walk to the nearest bookstore :-) and get working on
your license.  It's a riot.  Beats landline bbs all hollow, and once you
have your gear paid for, there are NO follow-on costs.

I'm looking for a good morse code tutor for the amiga computer, preferably
farnsworth method. If anyone has one please send me mail or reply here.
An FTP site is okay.

I don't know about France, but here in the US the Citizens Band has been
unlicensed for years. I understand that it is legal to use any kind
of callsign or identifier on 11 mtrs that you want, including your own
ham call, or anyone elses.

Sounds like a fun idea. What it would require though is a fairly directional antenna. (or is that really true? could you just use a kinda-non-directional antenna and rotate it until the signal is nulled?) What do you recommend for the "average" swl'er who would like to try this? The signal strengths of many of these stations that I've noted are reasonably high, so would a short (maybe 5-10 ft) rotatable dipole or "long"wire be a good choice? Please post some suggestions as to antenna and methods.

This is great! A new (mid-winter) antenna project!

>Oh, come now, we have ALL met them (except you, apparently) - at every club
>meeting, net meeting, hamfest, Hamvention, National Convention we ever went to.
>They're all over the place.

This is very strange...I belong to several local clubs and went to the South-
western ARRL convention. I go to local swap meets and know a lot of hams. I
just don't seem to meet the kind snobby elitists that several on the net say
they have been put off by. Now I don't say that they are not there and I'm not
impugning anyones integrity, but I am at a loss as to why the vast majority of
hams I know and seem to meet are friendly, normal people. Now it may be that
if I meet someone who is arrogant and small-minded, I very politely beat a hasty
retreat. Life is too short and I work too hard to have to deal with assholes.
What's happening here?

Let me tell you this. If the Amateur Radio Service loses its fundamental tradi-
tions of friendliness, openness and self-discipline there will be no Amateur
Radio in the near future. Further, anyone who does not believe in and practice
the traditions is directly responsible for its demise. There is no
"radio police" out there to keep order on the bands. If we don't discipline
ourselves and lead others by example we are history.

I hope the people described in Jim's post are just a renegade fringe that I'm
just not running into. I hope....

FM is not prohibited, but it is limited by 97.307(f)(1) to a
modulation index of 1. This limitation applies to all frequencies
below 29.0 MHz (see 97.305(c), under the column labeled "Standards").
If you don't know what "a modulation index greater than 1" is, I refer
you to the 1991 ARRL Handbook, p. 9-3. In essence, the rule means
you can't run FM below 29.0 MHz with your stock HF rig unless you
tweak your deviation to about 3 kHz.

I would suggest you *not* run FM at all on a band that's heavily
loaded. FM is just too wide! But when there's plenty of room there's
no reason not to experiment with it.

count.

No, it *has* to count because the FCC has already accepted the word of the
two Generals and has issued the Novice license.

When the dust finally settles on how the FCC will implement the new Tech
procedures, they will *have* to take the logical way out. After all,
the FCC doesn't want to make its life any more difficult. Thus, a Novice
will lose no privileges. The FCC will allow possession of the Novice license
to prove that 1(A) was passed. (After all, who is going to check this
stuff anyway, wandering bands of vigilante hams? No, a Tech's rightful

```
privileges will be checked by the only FCC if there is some reason
to believe he is abusing his privileges.)

  This corresponds to CM99.  There is a six letter designator, but this
  requires a location specified to within some number of seconds, which
  locates you to within a hundred feet.  If your location is exactly
  39deg 13 min 00 sec N, 121 deg 8 min 0 sec W, then your locator is
  CM99KF.  This calculation was performed courtesy of a utility within
  the HamComm programm previously discussed here.

>not Japanese, though ...)   However, if I were Japanese, I certainly
>would be offended.  What if I called a product from Taiwan a "chink-box?"
>Would you still have a "sense of humor?"

Rice box and Chink box don't resemble each other at so forget that simile.
Rice box is a cultural slur not a racial slur so it can be applied to imports
from Taiwan as easily as those from Japan.

Are you offended because Americans are referred to as Yankees or Yanks in most
of the world?  Are you offended if a Mexican call an American a gringo?  A few
years back when it was fashionable to stand outside the US embassy in many
countries and yell "Yankee go home" there were no comments in the US media about
Americans having their feelings hurt.  I submit that not one American in a
million gives a shit what nickname is applied to them in Cuba or Panama.

I really doubt that many citizens of Japan care what you call them or their
products just as long as you keep sending them money.  The top dog is always
resented by the lower echelon and today Japan holds the world as its personal
oyster.

>FM voice signal? I'd think that NBFM would be competitive with SSB
>(maybe even better due to capture effect?) if it could be squeezed
>into a comparable bandwidth.

The bandwidth of an FM signal is, at bare minimum, the same as an AM signal. It begins with two sidebands, just out of phase with one another so the sum is zero. At a certain deviation, the carrier power is zero and all the power is in the sidebands. As the "deviation" increases, more sidebands occur on either side; the deviation is really only an approximation of where the average power is.

Thus if you deviated 1/2 kHz with 3 kHz audio, you'd still have a 6 kHz bandwidth, with most of the power stuck in the carrier. It's equivalent to undermodulated AM, and thus a bad idea. That's why NBFM in the commercial world has a deviation ratio of at least 1, and 1.6 is more common.

That's a very rough non-mathmateical snapshot. Others may fill in the details and numbers.

From: clark@tomcat.gsfc.nasa.gov
To: winter@apple.com
Subject: Saudi Arabia

Patty -- I don't read rec.ham-radio, but apparently someone posted a note saying that tomcat was a relay station for health and welfare traffic to/from Saudi Arabia. Do you know anything about it?

Here is the situation: There exists a LEGAL path for 3rd party traffic to Desert Shield involving amateur channels following the path W3IWI ==> 4X1RU ==> 7Z1AB. This path requires that messages come in over amateur packet channels sent like ST 7Z1AB @ W3IWI.MD.USA and the messages need to be in standard ARRL radiogram format (and be brief, less than 25 words). As with all ARRL-format traffic handled on packet, the entire ARRL radiogram (header, addressee, text and signature) should constitute the text of the packet message.

We do not have any other channels. Traffic sent from internet hosts must be manually re-formatted to meet these standards and hence we are not in a position to handle traffic from the internet. Whoever said we were was WRONG!

Tom

I've seen many ads for an antenna analyzer program called
MININEC (and other variations of similar spelling).

Unfortunately, I don't understand exactly what I might expect
from the program. Can someone comment on what the program
does, and who might benefit from its use. Do I have to be
a rocket scientist (or RF engineer!) to understand/use it
or will it help me calculate the length of a simple dipole or
effectiveness of an arbitrary (ie random) length of wire.

Assuming you convince me that the program is a sound investment,
which of the several variations is best (and why)?

Can you point me to any magazine articles about the package?

Thanks in advance,
Joe Flake, N4BGQ

>Packet work. They'd be fine for a dedicated CW operator.

I'm running an Ic751a, which I like very much modulo a few stupidities such as no band stacking registers (they could have done it *so easily*, sigh). I understand it uses the same filters as the 72[56], 735, & c. That is, FL53, FL44, and so on. I too have the sharp SSB filters, but the 200 Hz rather than the 500 Hz pair. For a while, I found that the RTTY-Narrow mode (which gives me the 200 Hz filters) was indeed too narrow to use; it kept chopping off part of the incoming signal, and of course fiddling with the RIT was no cure.

Last night a light finally came on; it turns out the trick to getting useful work from the narrow filters lies in using the IF shift control to get the darned filter centered correctly. With this little hack, I was able to get pretty good copy on an S2 qso between a pair of W7's last night, while completely ignoring an S9+10 amtor qso only ~500 Hz higher. I was pleased with this - it's much better than what I had before. Watching a signal move all the way through the passband while tuning whilst only one digit changes in the freq display is novel :-). [I'm using a KAM; I suppose I could use the "modem tones" approach, but this is more generally useful imho, and a _lot_ easier to get right]. I haven't tried this in packet yet - I'll give it a kick tonight and report my results.

On a slightly different note, my impression is that the FM filter is too wide by about an order of magnitude. Sometimes I'll select FM mode just to have a listen to *all* the signals near my current freq at once :-). I suspect this filter was chosen with an eye towards transverter operation (can't think of any other reason to build it so incredibly wide, unless broadcast FM reception was a design criterion (!?)), but for 10 meter FM it's a joke. Has anyone got a solution, or a work around? Advance thanks to those who can help.

BTW, the Ic751a is my first rig. I bought it because I couldn't stand the thought of missing such a good bargain (it was almost new, and the asking price was extremely reasonable). I've been _very_ pleased, but my guess is anyone's chance of having that kind of luck at need is slim.

The local "FCC" (THK) over here issues a copy of the current
regulations to each and every amateur station (i. e. callsign) owner.
All the updates are mailed to the licensees as well.

In order to work around the rules it is a great benefit to know them..

|>A few dumb questions!
Not particularly dumb...

|>1) I come to the USA regularly (my parents live there), and have always got a
|>reciprocal license up till now. It's free, and grants Extra privileges (sort
|>of) for my UK 'A' license. I've vaguely been thinking about getting a *real*
|>license (an Extra, of course! :o). There's a VE programme here, so sitting the
|>exams isn't a problem, *but*, how do I find out what to learn? (Yes, I know I
|>probably know it all already, but there's got to be some differences). Where's
|>a good place to look? This "element 1A", etc., stuff baffles the crap out of
|>me. (We only have one exam for everybody.) I assume the ARRL publishes a book
|>with the curriculum? What's it called? (Oh Ghod, I'll have to learn Morse Code
|>*again*!)

Yes, you'll have to learn the code again. At 20 WPM, no less...
As for what to learn, the ARRL publishes books. They are good, but unfortunately there's one per license class, and each is incremental over the preceding one. Then again, if you get just the Advanced and Extra books, the rest will be trivial. (Don't just get the Extra: the Advanced test has a bunch of questions for which the Extra book doesn't prepare you well).

Alternatively, if you feel you know the stuff already, get a copy of the questions themselves. For each class there is a fixed set of questions; the total count is 10 times the number used for each test (i.e., the examiners draw 1 in 10 from the pool).

In addition, be sure to get the rule book; the ARRL publishes an edition that has both the full text and commentary. Apart from giving you the stuff you need to answer the regulatory questions, it will also help you understand "Part 1A" and similar gobbledygook.

By the way, sitting through the entire test sequence through Extra is exhausting! (You have to take ALL the written stuff from Novice to Extra if you start out with no US license. If you have to do it that way, go for it, but expect to take several hours and come out very tired.)

|>2) I've always borrowed a US spec 144MHz HT up 'till now, but I would like to
|>buy one. I'm not bothered about zillions of features, or dual-banding, but I
|>would like one that is easily switchable between UK and US specs and that is
|>reasonably small and not unreasonably priced. Does anyone have a recommendation
|>for a rig, and where to buy it from?

The key problem I can see is that no US rig I know of provides the 1750 Hz tone burst that's used on your side of the pond. I once tried to get the appropriate board to add to my TH21, but the UK importer for Trio/Kenwood refused to cooperate. I was glad to hear a few months later that the Kenwood main office had dumped that importer...

|>4) And finally, not a question, but a comment. What a sensible idea on the part
|>of the FCC to give you a codeless license. Approximately 50% of hams in the UK
|>have codeless licenses, and I would say that almost 100% of new entries pass
|>the exam, get a codeless license, learn the code and upgrade to a "with code"
|>license.

That's what I've been saying too...

For what it's worth, I have used and recommend the use of the connectors used for battery connections in radio controlled cars, boats, etc. These little gems are polarized, have a molded nylon shell with a positive locking device that can be operated with one hand, and can be obtained at almost any hobby store at approximately $2.00 for a set of two units. (2-male and 2-female connectors) The pin and sleeve contacts are totally enclosed and will accept up to a 12 guage wire without any problems. They should handle at least 10 amps without any problem. These units are basically a two-pin molex connector and are used to connect the power packs (fast charge/real-fast discharge nicads) to the vehicle being operated.

As a matter of fact, I had some little used 7.2 volt, 1200 maH packs at home and used them to build a super HT battery pack using the connectors described in the above paragraph. I wired two battery packs together via a small switch box to supply either 7.2 volts @2400 maH (parallel wired) and 14.4 volts @1200 maH (series wired) to my HT for extended portable operations at different power outputs. Select the 7.2 volts for low power/long useage, and 14.4 volts for high power/shorter duration usage. I fastened the two batteries and the switchbox together using double-sided tape, and put the entire unit inside a small padded camera bag with belt loops. The switchbox contains a small DPDT switch to provide the series/parallel switching, a diode (explained in the following paragraph), a blade type fuse for short-ckt protection, and connections for two pig-tails to connect the batteries and one for the cable that connects to the Handie Talkie.

In wiring the assembly, I wired a 4 amp 50 PIV diode in series with the lead from the pack to the HT to provide a .7 volt drop on low power from the pack or operating the HT from an optional 12 volt power supply. This diode is not located in the pack itself! I wired a second diode inside the switch box to provide a total of 1.4 volts drop when operating on high power. I did this to provide a little safety margin when operating the unit, as the fully charged battery voltage ouput approaches 7.8 volts, and the two batteries in series would provide over 15 volts, which exceeds the maximum dc input voltage for most Handie Talkies. The diodes provide enough voltage drop to protect your valuable HT from damage. The batteries may be charged with the switch set to the 7.2 volt position, using either a trickle charger (best way) or a fast charger (batteries get warm) available for these batteries at hobby stores.

By the way, these batteries are now available in both 1500 and 1700 maH rates and cost little more than the approximate $20.00 for the 1200 maH version.

Best regards,

Butch

>The bandwidth of an FM signal is, at bare minimum, the same as an AM
>signal.

I think it was in QST, perhaps 73, on the order of 20-30 years ago, at any rate in an April issue: There was a discussion of a new mode, something like micro-deviation FM. This was supposed to put a voice signal through an arbitrarily small bandwidth. Allegedly this new mode was catching on with all the cognoscenti, and accounted for the large numbers of apparently unmodulated carriers then plaguing the bands. Judging from what I hear today, the mode has not lost ground, although it is now little discussed in the press.
Deponent here runneth for cover!

>I am thinking seriously about putting up a 160 meter rhombic at my shack.
> Is there anybody out there who has experience with these antennas?

If you are primarily interested in 160 meter operation, I think I would recommend something other than a rhombic. Not only would the dimensions be huge, but you would have to get it reasonably high up in terms of wavelengths to get a good takeoff angle. Even 1/4 wavelength high would be about 130', and 1/4 wavelength is probably too low for good performance.

Another problem with rhombics (as I am sure you are aware) is that they are only good in one or two directions. They are good for point to point communication, but not for general use where you need performance in all directions.

Most of the stations that do well on 160 meters use some type of vertical antenna for transmitting, and beverage antennas for receiving. You could use your farm acreage to good advantage by stringing some long beverages on it.

If you want information on 160 meter antennas, just get on the band some evening and mention the word antenna. You'll soon have a large roundtable discussion going and get lots of good practical information from hams that have tried everything there. Antennas seem to be the most popular topic of conversation on the band.

Actually, the LO is NOT crystal controlled, but I'm glad you mentioned
the 5kHz problem. I hadn't thought about it. With no crystals at all,
the converter does not work with digital AM radio (I can't tune the
oscillator to a multiple of 5kHz). I'm going to have to spend some more
time thinking about how to do 5 kHz intervals.

> Clark@tomcat.gsfc.nasa.gov
>
> 73,
> Rich

Unfortunately Rich's message was mis-interpreted by some and I have been deluged with non-amateur Internet mail to be routed to Saudi Arabia. Let me clarify the situation:

Jim Stone, 4X1RU has set up a path for amateur radio packet messages to get to 7Z1AB in Ryadh, from whence they have handled local distribution to Desert Shield troops.

The >>ONLY<< messages that we have been sending thru originate on the amateur radio packet channels where they should be sent to your local Packet BBS as a brief (25 words or less) ARRL Radiogram format messages addressed like

ST 7Z1AB @ W3IWI.MD.USA

For the Internet folks, if you don't know what amateur radio is, if you do not have access to your local packet radio BBS, or if you don't know what an ARRL Radiogram is, then this service is not for you!

I have received a number of requests to route mail to troops in Saudi Arabia from non-amateur internet users based on Rich's message. Neither Tom Clark, W3IWI (clark@tomcat.gsfc.nasa.gov) nor Jim Stone, 4X1RU have some magic, back-door, free service for handling messages and we do not know of any such channels.

To answer some confusion, Rich's reference to FAXing messages applied only to the distribution WITHIN Saudi Arabia, not to the transport of the messages TO Saudi Arabia. Again, let me state that we have no magic route!

For those who have questioned the legality of this amateur radio connection, we in the USA are permitted to send messages to 3rd parties in other countries with which our government has negotiated specific 3rd Party message agreements. The USA does have such an agreement with Israel.

Jim was able to obtain special dispensation to relay the messages from Israel to Saudi Arabia, surprising though it may seem. Since our FCC has stated that they measure the legality of 3rd party traffic at the time the message is imported/exported across US borders, and since Israel is "legal", then these messages are "legal".

With the current level of hostility in the Middle East, I expect to hear that the Israel/Saudi link is no longer operational, but at this time I have heard no such news. I do know that one amateur station onboard a US ship in the area (N5DST) which was handling messages to/from the crew has ceased operation.

Regards, Tom

A good general source for this kind of thing is the Home Power magazine. It is published bi-monthly and always has sources for solar and other kinds of home made power. A lot of the avertisers are people that got into the business as a way to support there alternative lifestyles and are probabily easier to deal with than Arco, Inc or someone like that would be.

Their address is: Home Power Magazine
                    PO Box 130
                    Hornbrook, CA 96044-0130
                    (916) 475-3179

Back when I got my subscription they sent me a free copy to see what it was like. Good luck and have fun.

I've been involved with AT&T's HF marine radio stations for a number of years. My interest is primarily in HF data communcations but I also provide general purpose RF engineering advice on other stuff to them as well. Rhombic antennas are at the heart of these HF radio stations, both for transmit and receive.

The "book" that most of the technical people refer to about rhombics is "Rhombic Antenna Design" by A. E. Harper of Bell Labs. It was published by Van Nostrand in 1941. There's a wonderful picture on the inside front cover of a linear array of some 20 rhombic antennas that were installed at Manahawkin New Jersey before the war (WW-II) that provided point to point service to London. Now that's GAIN!!! (Actually, it wasn't;

the system was used for space diversity instead of gain enhancement; you put rhombics side by side for more gain, not end to end) Anyway, this seems to be the "book" that most of the rhombic info is based on. I doubt very much that this book is still in print.

Here are some rules of thumb and "how we do it"s that might be of interest. The feed impedance is somewhere between 300 and 900 ohms with nominal considered to be 600. When used for receive the terminators are big resistors (big so that they can better absorb lightning surges) at one end of the diamond and the other has a good size balun (say 50 watts worth if it was used for tranmit) to convert to 50 ohm coax. Coax is used to bring the receive signals back into the receiver building. For transmit, the output of the transmitter (50 ohms, 10 KW) goes to an antenna matrix that's used to connect different antennas to different transmitters. The output of the maxtrix goes to a BIG balun inside the transmitter building that converts the 50 ohm line to 600 ohms. There's one balun for each transmitter.

Open wire is used to get the TX energy from the building up to one end of the rhombic diamond. In general, about 20% of the energy fed into one end of the diamond comes out the other. If you short the other end of the diamond then you have a somewhat bidirectional antenna with a back lobe that's about 7 dB down. To get unidirectional operation, the short is replaced with a 600 ohm resistor that absorbs all of the 20% available energy and nothing flows back the other way. In practice, a resistor is not used. Instead a very lossy feed-line is connected to the far end of the diamond and the signal is brought down to eye-ball height where the lossy feedline heads back to the pole near the feeding end. The direction is not important. The goal here is just to have a long length of lossy feedline. Keeping it under the antenna just keeps it out of the way of other stuff. Usually, the far end of the lossy feedline is simply shorted together so the engergy that reaches the short has to go all the way back through the lossy cable before it can be radiated by the antenna. The lossy feedline that acts at the terminating resistor is just open wire that's made from iron instead of copper-weld.

I hope this information is useful. If you have the space and know which direction you want to go, it's tough to beat a rhombic for low installation cost, low maintenance and good performance.

Regards,

Paul Newland, ad7i

Our ARES group standardized several years ago on the Anderson Power-Pole connectors that started this thread. They are literally the best connector for this job that we have found. They are rated for 30 Amps, they are genderless, but cannot be connected in the wrong polarity, they do a very good job of insulating the contacts when not connected, and are relatively inexpensive.

Since that time, the rest of the state has started standardizing on the same connector. Not only that, but the local law enforcement agencies are doing the same thing. Now, when I get called to provide hams for some emergency, (I'm now EC) I can put my equipment into a sheriff's car with a minimum of fuss if needed.

This is a repost of an article I first posted on 1/9/91. I'm reposting it because I got -NO- responses. Nada. Zip. I'm hoping the reason that I got no responses is that the article didn't get out. (Hope springs eternal...)

I'm currently developing a drill-and-practice HyperCard (Macintosh) stack for people interested in becoming Ham operators, or interested in upgrading to higher licences (eg, tech to general). While I'm still in the process of designing the feature set, the stack will do the following:

- *let the user study the questions in sections (eg Rules and Regulations, Operating Procedures, etc.)
- *present the questions as a drill (says immediately if an answer is wrong, lets you ask for more info, etc.) or test (automatically goes to next question as soon as you've answered one, etc.)
- *presents the question (eg "3AA-1.1 What is the control point of an amateur station?")
- *presents the four alternate answers
- *lets the user answer by typing the proper answer's choice letter (A,B,C,D), or by clicking on the proper answer's field
- *keeps and displays total records (right answers, wrong answers, scores)
- *if the user wants, presents again the missed questions
- *provides additional information about a given question, and perhaps says why an incorrect answer is incorrect
- *plus a host of additional features as folks suggest them.

The stack will be shareware (or, as these things usually turn out, Freeware); it will be posted to the proper Usenet newsgroups when it's completed.

Here's where you come in: I need someone to type the questions and answers, to send me text files with the info already typed, or to suggest where I could get the textfiles. (My hands are full just designing and programming the stack.)

If you have this stuff already in ASCII textfile format, please send it to me ASAP. (All test levels needed.) You get prominent name credit on the stack.

If you type the stuff yourself, you get prominent name credit + 40% of any dough that comes in, after I subtract postage & media expenses. (OK, 50%. I don't want to quibble.   ;-)   )

Format should be:

```
                <number>  <question>
                A. <answer>
                B. <answer>
                C. <answer>
                D. <answer>
                <letter of correct answer: A.B,C, or D>
```

Here's an example:

3AA-1.1 What is the control point of an amateur station?
A. The operating position of an amateur radio station where the control operator function is performed
B. The operating position of any amateur radio station operating as a repeater user station

C. The physical location of any amateur ratio transmitter, even if it is operated as a radio link from some other location
D. The variable frequency oscillator (VFO) of the transmitter
D

This format is ideal; If you have this stuff in some other format, I'll take it!!

I'm also looking for suggestions for other features.

To prevent cluttering up net bandwidth, please email suggestions, curses, flames, files to me:

kamins@kumr.uucp   or   kamins@wet.uucp

But to allow for discussion, I won't use the "Followup-To: Poster" option.

Muchos Thankos!!

Believe it or not, I have both. If you think the Amateur regulations are complicated, try reading the Calif. Motor Vehicle Code sometime!

It can never be narrower than twice the highest modulation frequency.
If you modulate with a 3 kHz tone, even if deviation is only 1 Hz, the
sidebands will still be + and - 3 kHz from the carrier.  True, they
will be very weak, but if you filter them off, all modulation
disappears, and you have no way of transmitting the information.

There used to be a program in CompuServe's HamNet called SMITH.ARC. Dunno if
it's still there.

My amiga is equipped with a 020, 4 megs of (fast) memory, and 1 meg of (chip) memory. So I may have a slight advantage over some others. However with my setup Dave's package has been made to multi-task with many other programs. Overall WeFax has served me very well and provided some of the best 'Press Fax' photos ive seen.

Thanx Dave!

In our area we all use the 4 pin Cinch-type connectors. They are available at Radio-Shack and everyone is told to hold them so that they form a pair of T's, then wire the negative to the two horizontal blades (hint: they are the minus (-) sign) and the positive to the vert. blades.   Every once in a while our club makes a bulk purchase of the metal shell version for our members. They are a little more rugged.

It may indeed be true that "everyone has their own standards," but I thought that everyone (at least in California) might be interested that the State RACES group has adopted the Anderson Power Poles (one of the few "sexless" connectors I've seen) as their standard 12VDC connectors. If you're in California and have any interest in using your equipment on State power during an emergency, I suggest you look into them.

For hams in other areas - check into them. They're inexpensive and very reliable.

Disclaimer: I have no affiliation with Anderson other than being a satisfied customer (therefore having many connections :-)).

Yes, that is right. For full details, obtain Bellcore Technical Reference TR-TSY-000030. Mine is marked Issue 1, November 1988. The title is: SPCS Customer Premises Equipment Data Interface.

You can obtain docs on just about everything you want to know about the U.S. Phone system. Docs are published by AT&T, Bellcore, GTE and the U.S. Gummint as the FCC and REA.

To purchase Bellcore docs and get their fascinating catalogue, call the BELLCORE CUSTOMER SERVICE HOTLINE (201) 699-5800

[Phil's news server is acting up tonight so he asked me to post this for him. His copy will probably show up on the net eventually. --pw]

Tuesday afternoon I read in Aviation Week that only 10 of the DoD's planned 18 Global Positioning System (GPS) block II satellites have been launched and were operational. This means that the GPS navigation service is not yet continuous world wide.

It suddenly occurred to me that GPS coverage windows might be a factor in the timing of the US attack on Iraq and Kuwait; especially at the beginning of an nighttime air attack, precise and accurate navigation would be very important.

Since I have both the GPS operational status listing and a complete set of GPS satellite orbital elements, I thought it might be interesting to run off a set of GPS coverage windows for Baghdad. Unfortunately I didn't have time to write the program until well after the attack had begun tonight, but I think the results are still very interesting.

A GPS receiver requires at least 4 satellites to be visible simultaneously in order to produce an unambigous fix in latitude, longitude, altitude and time. (Theoretically, you need only three satellites if you have an accurate, i.e., atomic, clock in the receiver. But lots of civilian GPS receivers have been shipped to Saudi Arabia, and these certainly don't have atomic clocks.)

Here are the results.

Sunset in Baghdad occurred at about 1500 UTC on Wednesday the 16th (6pm local time). At that time, there was four satellite coverage. This lasted about two hours, when there was a 10 minute period in which only three satellites were visible, and then four satellite coverage returned for another hour.

However, at that point, coverage got much poorer (at one point consisting of only one satellite) until 2240 UTC when three satellites returned. Four satellites returned at 0040 UTC. At least four satellites were then visible until 0320 UTC. Four satellite coverage returned at 0600 UTC.

The actual attack on Baghdad started at 0000 UTC on the 17th. It seems to have lasted for several hours. And now a report on CNN right now (0612 UTC) says that a second wave might be starting.

Hmmm. Could it be...?

The region does have good continuous Loran-C coverage from permanent sites
in Saudi Arabia, and of course inertial navigation is probably available in
every US military plane and missiles. On the other hand, GPS is the most
accurate navigation system ever built. Its availability might have been a
factor in planning, especially given the billions of dollars that the DoD
has invested in it so far...

Phil

Harry Bloomberg WA3TBL recently asked::
>
>   What is the UK's experience with a codeless license? Have poor operating
>practices increased since the UK went no-code? Has technical innovation
>improved? What lessions can the US draw from the UK's experience?
>

I cannot speak for operating practices on HF as i do not have a licence for
those bands (HF? Thats almost DC isnt it?) but i do sometimes listen, and
can think of nowhere i would less like to work!
On VHF, well, there are occasional outbreaks of bad practices (such as the
jamming of repeaters) but this is more often than not done by people who do
not hold licenses in any case (i.e. pirates).
What *HAS* happened is that the number of active hams on VHF has *FALLEN* over
the last few years (there was a burst of new hams in the early 1980's, not
coincident with the no-code license (this was introduced in the 1960's), and
now the active ham population seems to be falling...)
If you hang around the repeater channels you will sometimes hear examples
of bad operating practices (doubling, people spelling out their calls
(and the calls of all other stations they are working) phonetically at
the beginning & end of every transmission) but such people soon learn.
We do have one possible advantage over the States in that we have a band
for which none of the big commercial equipment-makers supply anything....
I speak of the allocation between 70 and 70.5MHz.
People on this band have almost always got there by
building something themselves, or converting commercial gear, so they tend to
be the more technically-competent hams that use this band. You can also use
70MHz without fear of being interrupted by people from outside the UK wanting
to work you as DX!!   :-) :-) :-)   70MHz is really the 'experimenters
band' where you can hear double-sideband AM, SSB, FM, packet, CW etc. all
sharing the band in harmony and with respect for each other. What a
sanctuary of blissful relief from the baying hordes of 14MHZ contests!

70MHz is our 'alternative' band. I guess its the Britishers compensation
for not having any privileges around 220MHz.

The UK has just introduced a 'novice' license (simple exam gets you 3 watts on
VHF bands, take a CW test and get 3 watts on some parts of HF) but bearing in
mind the fact that theres not much difference in difficulty between the
written test for 'novice' and the written test for the full 'class B', i would
guess most people will go for the 'class B' and be allowed full power on VHF.
Holders of existing class 'B' licenses who pass the 'novice' CW test (which
if i remember, is 5WPM), will be allowed 3 watts in the novice sectors of the
HF bands. To get full HF privileges you need a 12WPM CW pass in the UK.

I am interested in Ham Radio Groups/Clubs in the Newark, NJ or
Northern NJ area. I would also appreciate any info on getting
started in HAM radio and how to get liscenced.

Harry P Bloomberg, WA3TBL,
(agate!bionet!uwm.edu!rpi!zaphod.mps.ohio-state.edu!unix.cis.pitt.edu!
hpb@ucbvax.Berkeley.EDU)
asks;

<...
   What is the UK's experience with a codeless license? Have poor operating
practices increased since the UK went no-code? Has technical innovation
improved? What lessions can the US draw from the UK's experience?
...>

I'm sorry, Harry, but I can't really answer your question in any meaningful
way. The UK has had a no-code license for longer than I've been interested in
amateur radio, and *much* longer than I've had a license. All I can say is that
we have our fair share of bozos too, but no more than you do, at least so far

as I can see (hear?), although ours tend to be on the South London 144MHz repeater rather than 14.313MHz!

73,

Hugh Davies, G0CNR.

(P.S. I would have mailed this, but there's no way my mailer will accept
"agate!bionet!uwm.edu!rpi!zaphod.mps.ohio-state.edu!unix.cis.pitt.edu!hpb@ucbvax.Berkeley.EDU"
as an address.)

Concerning VE sessions having a hard time processing applicants

who come in with certificates for elements 2 and 3a:
I am looking at a current 610 form. In the top section, to be filled out by the VE, there is ample room for latatude in specifying that certificates are being used for each requirement (although the section on applying credit for licences held may need updating, since T should no longer give you automatic credit for element 1a). But in section I, question 2, there are only lines (to be checked off by the applicant) for Examination for new licence and Examination to upgrade. This seems to imply that an exam must take place. It would be a good idea for the FCC to, when updating this form, change the word "Examination" to "application", but until the form is

updated, I'm sure any sane VE (and maybe even Dave Heller as well) could figure out how to submit the old form to handle the new case.

>magid@esis.enet.dec.com (Joel Magid...) writes:
>> Do they give the 5,13,and 20 WPM code exams as multiple choice ?
>> This should make for a lively debate here.

I've taken tests with ARRL and I've taken tests with W5YI. I'd say that MOST VEs give a fill-in-the-blank question test, but some W5YI VEs do use multiple choice.

Other hints that should be OBVIOUS but sometimes aren't. You get TWO chances to copy the callsigns of the two stations, once at the beginning, and once at the end. So you should be able to piece together the callsigns afterward if you miss some of it during the actual copy.

After the code is sent, you CAN fill in the blanks of what you missed, so go ahead and read back thru what you copied and fill in what you can figure out! You might get a minute of solid copy that way, too!

Each and every Morse code test MUST have at least one occurrence of: all letters A-Z; all numbers 0-9; the period; the comma; the question mark; the slant sign; double dash (BT); end of message (AR); and end of contact (SK). For the three prosigns, they should allow you to use WHATEVER designator you want, AS LONG AS YOU DEFINE THEM (for example, I wrote at the top of page, Greek alpha = AR, ampersand = SK, long dash = BT, and they accepted it). Almost guaranteed, the last couple of "letters" will be AR, followed by SK.

All prosigns, punctuation and numbers are worth TWO letters, when counting up a solid minute of copy.

For the 10 question test afterwards, DON'T leave any blank empty. Even if you don't know the answer, look at what you copied and make a REASONABLE (or even unreasonable, if you copied nothing for that item) GUESS. They don't count the wrong answers against you, and maybe your guess will be right!

While the prosigns KN (used at end of one side of a contact, meaning back to you), and AS (meaning wait) will NOT be on the test, they are useful to know, if you listen to real contacts on the radio, or if you listen to W1AW.

Diana

There has been a bit of confusion regarding the address for obtaining help on my email callbook server. My previous posting may have been ambiguous, so I'm reposting the information. Since there have been so many requests for the help file, I'm going to post it here again.

Please note that the address is "callbook@sat.datapoint.com". The other address, "callbook-help@..." goes to a real live ham radio operator type person (me!), and should be used only if you have additional questions or comments.

Thanks,
73/Lee, N5LYT

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

```
     lookup <callsign> [<callsign> ...]
```

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

```
     path - specify a return address (user@domain or bang!path!user)
     help - return this help text.
     quit - quit scanning for commands.
```

Path should not normally be needed, since the mailer should be able to resolve your address. If you do not get a response from the server, you might try including a path command.

Quit is not usually needed either, but may be used if you have a signature that contains things that look like server commands.

Examples:

```
     lookup n5lyt           <= About as simple as you can be

     lookup n5lyt ns5i ka5pfm    <= Look up more than one call

     path bob@foo.com       <= A bit more complicated example
     lookup n5lyt
     quit
```

If you have any questions, send mail to callbook-help@sat.datapoint.com.

Thanks,
Lee Ziegenhals, N5LYT

do any of yall have an theories (ahem ahem) about how the CNN cats in the baghdad hotel managed to keep their audio feed alive?

there was obviously a phone link involved on the US end at least, but the reporters on the scene were using a *microphone*, not a telephone to talk into. plus, other networks phone links were not working. and the baghdad telecom CO is apparently missing part of its top floor, as well as having many melted satellite dishes.

```
my theory is that they used some sort of radiolink to get to someplace
where phones were still working.  some sort of radio-repeater link
set up with local hams, perhaps?  with enough links to get to a
working telephone?  you rec.ham-radio cats are probably familiar
with this sort o technology -- ham to phone links.  what do you think?

The February 1991 issue of _73_ magazine has several neat microwave
articles, also a list of sources of microwave components on page 52.
One of the sources is:

SHF Microwave Parts Co.
7102 W. 500S
LaPorte, IN 46350

I sent SASE and got a catalog sheet which lists 10-GHz oscillators for
as little as $15.

In article <27080053@col.hp.com> kenw@col.hp.com (Ken Wyatt) writes:

>I think what you are doing is GREAT! I wonder if the average non-ham would understand what an "Elmer" was. You might think about using an alternative word.

I've been reading this group for a few weeks and don't know
(that I'm not part of the "Illuminati" of the waves is obvious)

I at first suspected it was another code fascist buzzword, but considering my naivete, thought that a bit harsh - so what does "elmering" mean?

speaking of code --- my bro still has a code practice machine which he braeks out occasionally to remind me of the laborious process he suffered to obtain his General back in '61 (forgot the name - uses paper tapes). I of course sat there beside him as he constructed his first Knight Kit transmittre (the one he keeps promising to give me as soon as I get my Novice), I tuned the waves with him, I spoke on his station, I felled long slim trees on field days and hefted them to the tops of hills, dug post holes to plant them and helped string the dipoles - all this effort rewarded by as much beer as I could hold (quite a reward for a high school kid). But ny brother doesn't have the enthusiasm he once did - which didn't help my resolve to learn the code.

the last time I prepared to get up to 5 wpm (I'm sure I did) I looked at the non-renewable Novice license as a waste of my time - I didn't plan to increase my speed just to get a General and at that time VHF was not attractive to me. MAybe its a genetic trait, but code has been the stumbling block to all my relatives who have had the interest and the technical knowledge to get into the "hobby" - epecially for one - my uncle who built his own transmitter in the early thirties who never learned the code well enough to meet the relicensing requirements when he let his early license lapse. What a shame - after his death last year my brother cleaned out his shack (it really was a shack built esp for the purpose - between the orchard and the rabbit hutches on the path to the outhouse - funny, now that I think about it, his interest in radio dropped sharply after they installed indoor plumbing in '65. Hmmmm.....)

What was once an active setup is now a virtual museum piece in a spare
bedroom. And to think that it was the code requirement that silenced
that radio pioneer. What a SHAME.

An article disscussing the merits of micro-modulation in the April
issue of QST is somewhat doubtful as to it technical merits. An
on going tradition in the April issue is, of course, the April fool
article. Sometimes one has to read very carefully to determine if
the article is in fact the April fools article.

Does anyone have a program that gives you the same information as a
Smith chart? I'd like a program that has inputs of line Z, line attenuation,
and termination impedance a+jb, and gives you the transformed impedance
at some distance from the termination.

It's a FEATURE! It has many purposes.

It can discharge lightning from one dipole into the other.

You can connect the balun in the middle of power lines so you don't
have to pay for wire.

:-)

Well the FCC writes these legal twists in the rules so let THEM get you out of them. Sent a NOTARIZED copy of your CSCE's that have not yet expired, with a completed 610 form, directly to the FCC. Attach a letter citing the new rules and ask for them to issue you a license since you now qualify under the existing rules (after Feb 14).

There is no rationale because 160 meters happens to be the ONLY HF band
on which voice *IS* allowed on the ENTIRE BAND.

How many hams in the USA have a copy of the current rules?

Element credit on a CSCE is good for 1 year from when you passed the particular element. If element credit is carried over it is still from when the original test was taken--the FCC and VECs maintain this information.

Howdy...

I have tried the following numbers in the Dallas area code (214) and these are my results:

214-960-2730	(NN5I BBS)	DISCONNECTED/NOT IN SERVICE
214-517-4958	(Ham Shack)	DISCONNECTED/NOT IN SERVICE
214-223-0983	(Mark Collard)	Business Voice Phone, never heard of Mark Collard

I didn't try the D.R.I.G. number because I am reasonably sure they are still there.

Anybody know about the Hallicrafters SX-140 receiver?

I have an old one -- I don't know how old it is -- that I've been using. I hooked it up to a long wire strung around my attic, and it seems pick pick up things from all over fairly well.

Being a beginner at this, I'm wondering, how good is this model? It's got SSB and a BFO, and seems to work pretty well, but I have no idea how it compares to what the rest of the world uses. It looks pretty simple inside -- lots of empty space and five tubes.

How hard would it be to modify it to receive other frequencies? It has bands for 80, 40, 20, 15, 10, and 6 meters, and I'd like to be able to receive on some "in between" frequencies.

Thanks for any help!

OK everybody (especially you AMSAT gurus), where can I find info (plans) for building a Linear Translator?? I have mentioned this before and never heard anything concrete. I would like to build one. Who can tell me how? It's done on the OSCAR's, so somebody must know how. Point me at some references please.

Just a note in favor of the R5...As far as bandwidth goes my SWR is less than 1.7:1 on all bands, 10,12,15,17,and 20. So the bandwidth argument above does not apply to the R5.

With the upcoming VHF contest this weekend, I need to know what
Grid Square I am in.

I would like to know how to figure this out knowing what my
Latitude and Longitude are.

Are there two designations for Grid Squares, 4 and 6 digits?

Thanks,

Randy

Oh really?  Which one?  Larsen happens to have the widest variety of
antenna mounts I have seen.  They have so many in fact I forget which
one it is I ordered for my dual-band mobile antenna.  I did choose the
one which had the widest variety of antenna types and got a mag-mount
base with that type.

Howdy:

Is there anyone on this net that can answer from first hand knowledge
whether or not DRSI has closed its doors?

I think it would be a shame if this were true but cannot say that I am
surprised for many reasons, which I will not bother your with. They
filled a nitch that needed filling with their plug in card.

Surely someone can give us an answer.

Bob

I have recently been shopping around for some VHF
transverters. I have found a couple of things that
you may find interesting (or depressing):

1. Microwave Modules is out of business, according to the lady at Spectrum International (long-time MM dealers);

2. SSB electronics makes nice transverters, but they cost about $750/band.

Like, MegaBummer, Dude!

(sorry, I couldn't resist.)

Actually I run 7/8" heliax up the tower on 1200 MHz but 9913 isn't too bad for price/performance. Watch out about using it in the high vhf/low uhf range though since production problems can cause sharp periodic (in frequency) attenuation increases.

Great, Pete! I would like to see that sometime. I have the GTI panadaptor that connects to a o-scope and have been mostly happy with it. It is *not* anything to compare with a spectrum analyzer but is great for monitoring. While on the subject I have a question:

Can anyone recommend a small (fit nice on the desk) maybe LED o-scope that is not too expensive? I would like to get one for the panadaptor that would not be too obtrusive. I don't need a lot of features or resolution or speed, just a reasonable display and small size.

jv

Clarification: You can connect a source to a source, causing fireworks,
if you don't check wire colors. The source and sink connectors are
identical but for wire colors.

> They use female Molex connectors with female pins in the holes -- very
> safe.

Correction: The sources are *male* Molex with female pins in the holes.
Sorry about that. The female Molex connectors (sinks) have the (male)
pins exposed within the housing.

Below 29 MHz., you can only use NBFM, defined as a signal no wider than an
AM signal (basically 6 kHz.). On 1.8 to 2.0 MHz., even NBFM is not allowed.
I don't know why, but my guess is to avoid interference to LORAN.

Interestingly, the multiple-choice test is harder to pass than the one-minute-of-solid-copy requirement. In the VEC exams I have helped administer, there have been many people who got less than 70% on the multiple-guess but passed on the one-minute-solid.

If I remember right, the Technician WITH code requires you pass the 5 wpm before 3 certified Volunteer Examiners. The Novice license only requires 2 General-class hams for the test. This may be the reason it doesn't count.

I once heard a talk by a UNIX consultant on the subject of standards.

His point was that if the current attitudes about [UNIX] standards applied
to homes, the prospective home buyer might have the following conversation
with a home builder:

Buyer: What about standards?

Builder: Standards? Of course we have standards, but they're better!
175 volts! 70 Hz!

I think the answer is bandwidth limitations. Above 29 MHz, the rules
permit "wideband" FM. "Wideband" means "wider than an equivalent AM
signal." Note that what is called "narrowband" FM on VHF (5 kHz deviation,
about 13 kHz bandwidth), is not legal below 29 MHz.

FM is quite legal on 75 meters (last time I looked), but you have to
limit the bandwidth to 6 kHz, which means very narrow deviation.

the reasons that some stores won't accept banknotes greater than $20 is
because they can't make change for them (they don't keep more than $50 in the
till). i'm sure they'll be happy to accept your $50 note if you don't want
change ...

(and yes, i know this is bogus, and yes, i do avoid these places whenever

Ham Radio Phone BBS List 1/91

The following is a list of some telephone BBSs that support Amateur Radio. Some of these are strictly for hams, while others support "SIG's" (special interest groups) for hams or have radio-related files or message sections.

Disclaimer: Due to the increasing size of the list, it will only be distributed on the packet networks once or twice each year as a multipart bulletin. Some SysOps consider even the split-up messages to be an overwhelming burden to the network and will inevitably block them, so if you do not receive it via packet, you should download the file HAMPHONE.91 from the Ham Radio archive section of SIMTEL20 (wsmr-simtel20.army.mil on Internet), from the K4NGC phone BBS at (703) 680-5970, or from the WB2COY phone BBS at (914) 485-3393.

If you call one of these BBS's and find nothing to indicate it's relationship to Ham Radio or find that it has been disconnected, let me know so I can archive it and clean up the list. I can't gaurantee the accuracy of this list, but I do strive to keep it as up-to-date as possible. Please send any updates, changes, or comments to me. 73, Tom Brown KA2UGQ.

In some random news article, scottl@convergent.com (Scott Lurndal) writes:

> This same sort of thing also applies to establishments that refuse currency
> denominations greater than $20, I believe. The wording on all currency
> states that it is "legal tender for all debts, public and private".

As pointed out by a leading consumer magazine, 'legal tender' does not imply obligation. No person or business is required to accept cash in any form - $20 bills or singles.

In article <22638@rouge.usl.edu>, jpd@pc.usl.edu (Dugal James P.) writes:
|> Or, get one switched by DC on the coax (Icom and Ampire make them, or
|> add a choke in the preamp to pass the DC and block RF).

A comment on feedline-powered preamps: there are at least two general varieties, relay switched and PIN diode switched. The relay switched models can handle more RF power, but they generally take a lot more DC current. In some cases this can be more than the supply in the rig can put into the coax.

I discovered this when I tried to use the Icom relay-type preamp with my Icom 471A 70cm rig. This is the low power version for which Icom had a PIN-switched preamp, but I had opted for the relay type preamp anyway because I have an external power amplifier. I then discovered that the 471A's preamp power switch circuit limited the preamp supply current to a level below that needed to pull in the relays in the preamp.

I worked around the problem by reducing the size of the resistor using in the current sense circuit in the 471A and hoping that the switch transistor wouldn't be overstressed by the extra current. So far I've gotten away with it.

Phil

Does anyone have a QSL route, home call, or other info on T30WW?
I and several friends in the area worked this station during the
CQWW CW test last fall. No one seems to know who it was or whether
he/she has a QSL mgr.

>I am thinking seriously about putting up a 160 meter rhombic at my shack.
> Is there anybody out there who has experience with these antennas?

I once built one for field day one year (single-op, I placed first
in the 4th call district and something like 4th or 5th overall). It
was about 250 feet on a side, built with copperweld wire, and was maybe
40 feet above the sandy ground near Lizard Lick, N.C. :-)

Worked magnificently, a 20KW signal with 100 watts. Sigh.... Had it up for one weekend, and it's still in my garage after all these many many years....

I "designed" it using ARRL handbook (Antenna book) to make the takeoff angle optimized for 20 meters, but it worked very nicely 80-10m.

>My understanding is that the feed-point impedance is 600 ohms or so. I
>would imagine that 600 ohm feedline would work well from the antenna to
>the shack, but once inside the shack I need 50 ohms. Does that mean
>that I need a 12 to 1 balun? If so how do I "make" one (I'll buy one

Yes, but what I did was to put the 12:1, balanced-to-unbalanced balun *at* the feedpoint (with a plastic cover, although it didn't rain that weekend as I recall), and used coax down to the "shack" (which was a tent).

>if I have to but I want to "learn" something)? I have the ARRL
>handbook, Antenna compendia 1 &2 , as well as the antenna matching book
>but they don't address this problem completely and I want to get this
>antenna up before winter is over so I don't have time to "school"
>myself on the fine art of matching.

I figured out how to build the balun from the ARRL handbook, same algorithm as mentioned in the book, just different parameters. Worked perfectly. I remember it being "interesting" doing the winding though.

>I'd like the antenna to be run
>as an all-bander and this should be possible with a tuner (am I
>wrong?).

Should be nearly 1:1 on all bands with no tuner. Both the antenna (and hopefully your balun) will be broadbanded. Make sure your transmitter is harmonic-free, any harmonics will be transmitted magnificently.

>The terminating resistor, required for omni-directional
>operation, should be the same value as the feedpoint impedance. Does
>this mean that I need a 2KW 600 ohm resistor? If so where do I find

Only if you are operating illegally. Aren't we limited to 1500 Watts OUTPUT power now (output power being the only power the antenna sees)? Even still, I think the requirements were something like 25-35% of the transmitting power although my memory is fuzzy on that one. I used several non-inductive power-resistors in series. The resistor needs to be non-inductive. Normal resistors are rated at a higher ambient than outside in the open air, so they may be a bit pushable. Also, unless you transmit key down (using RTTY w/the rhombic?), duty cycle might be taken into account. Of course, mine only had to last the weekend, and it would not be all that disasterous had it blown anyway.

>one?

>I live in an old farmhouse with lots of room to put up this

Good luck. They are easy to build if you have huge amounts of room and trees in the right spot (like an open field surrounded by trees is perfect).

Phil Howard asks Gary Coffman:

>> ... the lower portions of HF where FM is not legal ...

> What HF bands is FM not legal on where voice is otherwise legal?

This is one question I have had myself.

I have never seen explicit mention in the FCC rules prohibiting FM on frequencies below 29.000 MHz. However, it is a fact that the only frequencies where FM is practiced on HF are between 29.000 and 29.700, especially between 29.100 and 29.300 plus between 29.500 and 29.700. (29.000 thru 29.100 is primarily the AM subband. 29.300 thru 29.500 is the satellite subband. FM can be used in both subbands if it will not cause interference.) It is also a fact that in some countries, FM is indeed limited by law to the higher portion of 10 meters.

Is there any legal limit on bands we can use for FM? Does anybody know for sure?

Here is another one for the Oracles: does anyone know for
sure what the definitive rules for Beacon operation in the
U.S. is?

The FCC rulebook seems to have incantations about Beacons in
10m-and-above-only and yet we have the two U.S. beacons on
14,100 kHz. Special dispensation or is the rulebook dated?

Also, what is the longest Dash one can send before it is no
longer considered to be A1A, but is N0N instead?

I would love to be able to use beacon mode for antenna
measurement purposes, at least on 15m. ...not that I don't
trust the accuracy of RSTs :-) :-).

Sure, why shouldn't I? I am not from BV-land. Never set foot
there. Ever. As a liberalized person, you are not trying to put
a racial stereotype on me, now, are you? Tsk, tsk. :-) <- Smiley alert!

More seriously, I distinctly remember the original poster said
"Asian Ricebox." Feel free to assume that, as an Asian who
consumes a lot of rice, I am offended by that phrase, but truth is,
I simply cannot get worked up over it.

As I read it, the original poster was making degrading remarks
on Kenwoods and Yaesus, not Asians; nor, heaven forbid, our rice
containers!

Yep, sure am Chinese myself, but not from BV, OM; first came
into this world by way of HS-land.

I have encountered racism. However, this one is not even close,
Randall. Maybe I am too soft on a fellow Ham... oops, there I
go offending someone - I meant Radio Amateur.

Sorry, I can't quote the FCC chapter and verse, but FM is allowed
by the FCC on bands below 29.0 MHz ONLY IF THE BANDWIDTH DOES NOT
EXCEED THAT OF A (DOUBLE-SIDEBAND) AM SIGNAL. The standard type of
FM that is used on the amateur radio bands is wider than this, so it is not
used below 29 MHz.

The VE is permitted to choose his own method of testing, but it's generally
a ten-question test, with 70% passing -- or a minute solid copy which
is always the ultimate pass.

Fill-in the blanks, multiple choice, true/false.

I prefer the true-false; ten questions. 10 per correct, 0 per blank, and -10 per incorrect. Properly done it separates the men and women from the boys and the girls.

Too many of the fill-in-blanks, which most crews use, are too easy to bust. Just copy the "obvious"items such as callsigns, etc. The punctuation never shows up, so disregard.   Try a test with us. If you don't know how to copy you have a problem.

Make a parallel-tuned circuit with the open-wire feeders connected to each end. Ground the coil center tap to coax shield, and connect the coax center conductor about 1/2 to 2/3 up from ground on one side. (Adjust for lowest SWR) I would try about 10 uH and 750 pF (nominal value -- make it variable and tune for lowest SWR).

>I'd like the antenna to be run as an all-bander and this should be possible

>with a tuner (am I wrong?).

Right. The impedance should be in the general vicinity of 600 ohms or so on all bands. You'd have to retune the above tuned circuit, of course.

>The terminating resistor, required for omni-directional operation, should
>be the same value as the feedpoint impedance. Does this mean that I need
>a 2KW 600 ohm resistor? If so where do I find one?

The terminating resistor is required only if you want a UNI-directional pattern. Without it, the antenna is bi-directional. (Also the impedance is more constant with frequency with the resistor.) Temporarily use a variable resistor on receive to tune for best front-to-back ratio, and then replace it with a non-inductive power resistor of the same value. As I recall, about half the transmitted power is dissipated in the resistor, so for 1500 watts output, you would need a non-inductive resistor that can dissipate 750 watts for whatever duty cycle you will be using.

>I live in an old farmhouse with lots of room to put up this antenna and I
>believe this could be my once in a lifetime chance to work such a monster
>antenna. Any help you can give will be greatly appreciated.

This will be a VERY big antenna. If it is, say, 4 wavelengths per side, each side is over 2000 feet long, with the entire antenna about 2/3 of a mile from tip-to-tip! It should be as high as possible. 1/4 wavelength would require 130 foot masts, and 1/2 wavelength would be better. The angle between the wires is important for best directivity, and is a function of the length (in wavelengths) of each side. Although it will only be optimum for one band, you will get gain on the other bands as well.

The ARRL Antenna Book has (or at least used to have) a good section on rhombic design.

The tips on how to pass a code test show how ridiculous
the current tests really are. The old solid minute tests
like the FCC gave made sense.

At most VE sessions it takes the ability to copy about 8 to pass
13 and copy about 15 to pass the 20.

You don't have to know much to pass ANY written test. Just have
a good memory.

Sorry, but that's the way it is now, and that's why we have
Generals and above BUYING   DIPOLES and asking
__what's an ohmmeter? ___

K3TX.

In article <1250333@hpnmdla.HP.COM> alanb@hpnmdla.HP.COM (Alan Bloom) writes,
about 2-pin Cinch-Jones connectors:
>The Drake UV-3 uses this connector for power supply. Of course, they
>used the LARGE connector for +12V and the SMALL pin for ground.

They weren't the only ones, either. The Clegg FM-27 series (at least the
-B I had once upon a time) wired the pins this way, too. Naturally, that's
how I standardized, since that was the first 12-volt powered rig I owned.
I wound up, eventually, rewiring every connector I'd made up...

Technically correct.  They do have to accept legal tender.  But, they do not
have to make change for big bills.

If you hear LY2WW or any other stations from Lituanina and the other
baltic states (Latvia is under trouble already..), and if thay have
any messages to be forwarded, do so! And if you are a ham and want to
chat them, note that these frequencies have emergency status. If they
have time to normal chatter, do chat but if there are messages, please
obey good operating practice.

Randall Rhea comments in response to Kok Chen:

> "Ricebox" is intended to be a derogatory term aimed at a particular
> nationality ... if I were Japanese, I certainly would be offended.

Anti-Japanese terms sadden me not because I am Japanese but because they hide the true cause of discomfort. When I hear remarks like "Japs make riceboxes and sell them to the U.S., only to use the money gained this way to buy Hollywood", I notice a deep lack of understanding of one's own self; an arrogant ignorance. If you hate something so badly, why mention it at all unless there is a vacant yearing in your soul groping for something better? If you seek fulfilment, why not work harder to better your environment?

The recent "Radio Shack bashing" seems to me another instance of such under-fulfilment. People hate not Radio Shack but the lack of a better store to shop at. It is the shortcomings that are not remedied that cause anger. You can think of this in terms of customer dissatisfaction and hence opportunity for money to be earned, if you prefer. My oriental values liken it to a child who shakes his fist at a rain cloud, not because he hates rain but because he cannot go out to play. Do not blame rain nor Radio Shack nor the Japanese for what you cannot do.

Perhaps I am sounding too "zen". Let me say that if you agree with me, then there is no need for reasoning. If you do not, at least it was worth my effort to state my feelings.

We sure do offer NOVICE Exams at a VE session. I am contact VE for the
Madison Oneida ARC VE session and we have allowed Novice exams at every session
for the past two years!

BTW we run W5YI exams every month (the third FRIDAY) at 7PM. Always walk-in.

I too had the same problem with the squelch, it is possible to
get a copy of the modification needed to get it to function properly?

I also tried (without success) to troubleshoot the squelch circuit. My
receiver also has been put aside because of this.

In article <1991Jan12.220214.3135@n3dmc.svr.md.us>, wa1lbp@n3dmc.svr.md.us (David Cowhig) writes:
| Rumor has it that the Soviets build a resonant cavity into the walls
| of the building that would reflect microwaves of a certain frequency
| (I think these are used for testing at airfields). The resonant cavity
| has a diaphragm which vibrated changing the resonant frequency of the
| cavity. People talking in the building would make the reflected signal
| shift in frequency -- frequency modulation.
| This passive bug required no power source so it couldn't be found by
| conventional methods. The Soviets could compare the input to the reflected
| signal and extract the intelligence from the signal.
| Supposedly the Soviets found the design for this device at the US Patent
| Office among the hundreds of thousands of patents which flow through there..
| So here is a case where a reflector was a true transmitter.

In "Spycatcher", a book about the career of an electronics expert
for British counterintelligence, Wright claimed this was the design
by a german captured by the soviets.

I've been trying to settle on a standard connector for my own use lately. At one time I used 2-pin Molex connectors (similar to the 3-pin ones that are standard for PC disk power connection). The main problem with those is that they are meant for internal equipment wiring and therefore have no strain relief at all.

Next I copied my father (PAoJKG) who uses 2-pin DIN plugs, which are used in Europe for speaker plugs. These are similar to the Cinch plugs but not interchangeable. The problem there (with the Cinch ones as well) is that you often end up with +12 exposed on the pins. The connectors are also fairly large for portable gear.

At this point I'm settling on the "coaxial" type plugs, as used in most portable consumer gear ("battery eliminators" etc.) with the + in the center. Those plugs are small, sturdy, and the +12 is almost completely shrouded by the plug. One minor hassle is that there are a number of different size plugs, but the 2.1mm center conductor size seems most common and works well.

Sure, it's perfectly legal. In fact, there's quite a bit of AM on "top band" (one of the last bastians).

The Drake UV-3 uses this connector for power supply. Of course, they
used the LARGE connector for +12V and the SMALL pin for ground.

Murphy's law, I guess.

But the database in marvin hasn't been updated yet. In the 1991
callsign project tape (thanks Rusty!), there is no entry for a WB8ECC,
so I would guess he is either no longer a ham or is a Silent Key. I
suppose the address in the previous database would be as good a place
as any to start, though.

I forget where I read this (CB magazine I think), but the idea was to
fill your hubcaps with shredded aluminum foil to "foil" the radar.

I presume this is in analogy to the foil dropped from planes in WWII
to confuse enemy radar.

Sure... if you will allow that I power my camcorder (actually a camera and separate recorder) from a 2.5AH gel cell battery pack. Same pack works fine to run the HT. And the VCR tuner base has a built in charger that does a nice job on the gel cell (given a connection through a battery-shaped adapter).

I am thinking about putting up a 1.2GHz repeater. From other people who
own repeaters on this band I have some specific questions:

- What antenna do you use?

- What is you elevation of you system?

- What kind of coverage do you get?

- What do you use for the repeater radios?

- Do you use a Duplexer? What brand?

- What is the output power of the repeater?

- What type of feeline are you using and what is the length?

Thanks in advance repeater owners!

Wonder if anybody would be willing to look up some addresses and e-mail them to me? My callbook is an '89 - and my online callbook server gives no help on these.

KG7IU, KB7LPR, KB7MEB, NL7TB, KB5KTY, AA5PP, KB7IYO, KC4NBC, KC4PBQ, N5PZP.

Also have two canadians I can't find, VE1REC and VE5BF.

Sure would appreciate the help on these. Some of them may not be good until the '91 callbooks, BTW.

Something that has not been mentioned to date is the fact that purchase data is very valuable to marketers. If they know that Joe Blow purchased a stereo at Radio Shack, RS can sell this info to record clubs, etc. This scenario is very common today and can be a significant source of income.

There was a very chilling episode of Nova a month or two back about the (ab)use of marketing databases. Some of the more sobering details involved the use of POS terminals with scanners linked with credit card data to generate purchasing history data about individuals. Makes you think a little bit the next time you start to whip out that plastic.

Yeah, I just figured that a competent tech could do it in 15 minutes. But maybe it takes that long just to open the machine and button it back up.

But I guess most of the folks at the clone shops are just into swapping sub-assemblies.

> power supply.

Ditto, I had that same experience last summer. A nice side effect of
becoming a ham is that now I have a rational, consistent 12V power
connector scheme for all my related toys, many pre-existing. It took

about 30 connectors.

What kind? Well, one friend uses two-conductor half-polarized plugs like you describe. What's wrong with them is they are not dummy-proof. You can plug things in "backwards".

I settled on a Molex connector system identical to a different ham friend's. It uses six-conductor 2x3 Molex connectors available from RS and other places, with 0.093" pins. Why six pins? Then you can run four extra lines through any connector, in addition to power, such as speaker, mike, etc.

The connectors are fully polarized such that, once correctly wired, you CANNOT mis-connect them unless you build a weird toy, which is then to be used with caution. Of course, since they're not color coded or anything, you're well advised to stare at them carefully when wiring connectors. Usually I clone from an existing connector and ensure identical or symmetrical wiring.

Part of the process was to identify all items bearing connectors as "sources" or "sinks". The sources are power supplies, batteries, etc. They use female Molex connectors with female pins in the holes -- very safe. Sinks are current-eaters, with opposite polarity plugs and pins. Curiously, solar panels are sinks because they charge batteries.

The only gotcha is the nylon connectors sell for about $1.40 each.
Ouch.

Or, get one switched by DC on the coax (Icom and Ampire make them, or add a choke in the preamp to pass the DC and block RF). But I read recently that in satelite mode, while transmitting, don't move the sat. mode knob or you risk a spike which could take out the GaSFET.

>   2. Band switching is awkward - to get from 2m to 6m you have
>   to go through 220 and 432

Yes, this is true.   You must press the band button up to three times instead of once.

>   3. You can't copy SSB while in the CW mode, even w/o the CW filter

Yes also. At least they did provide a narrow filter option as std. eq.

>   4. There is no provision for out-of-band RX.

I have seen a MARS mod, but I would expect poor out-of-band rx performance. This radio is not nearly as susceptible to intermod as the wide-band rigs, and I'm glad they made this trade-off.

>   5. I have been told that it's hard to connect to a TNC, but
>   ask someone who has tried.

Not true; it's easily done through the 'data' jack on the rear. Just don't believe the ads that claim this permits direct FSK! However, G3RUH has posted how to do direct FSK and tap into the discriminator for rcv. I just made the mods this weekend in preparation for running a G3RUH 9600 baud FSK modem.

> 6. Incredibly, there is no provision for A=B with the VFOs.

Yes, I really miss this.

You can easily determine xmit PL tones by clicking through the choices while listening for audio with pl-decode enabled. Also, the 1.2GHz module has built-in provisions for ATV.

Walter
Well, I got the 40M QP rig built this last weekend. Eveything went smoothly. Instructions were clear although I might have taken a different approach to putting the kit together if I just had a pile of parts and a schematic to wok from. They tried to set up landmarks on the PCB to aid in the location of the smaller components. This made it sometimes a bit of a squeeze to get small resisitors into some tiny areas. But all in all things went well. When it came time to fire it up is where I hit my first snag. I have a little Micronta PS at home that I run my HT with. I disconnected the barrel connector from my HT and plugged it into the power connecter on the transmitter. What I forgot to check was the polarity of the plug. The transmitter has a + tip,my plug had a - tip! Well the first component to complain was the electrolytic. It hissed and then spewed. Luckily I had a replacement in the junk box and I rewired my plug to satisfy the rig. I had no key so I used a screwdriver blade across the key connecter and ,oh joy, a tone sounded from the rx.

I guess what this all boils down to is double check _everything_!! Now all I have to do is wait for my novice band crystals to get in and I'll be burning up the airwaves with my 1 watt transmitter!

I have been very pleased with both my purchases from Ramsey. Earlier I had picked up their 2M amp at the Houston HamCom last fall. I have been very happy with it. One thing though, if you live in a metropolitan area or any area that is RF active you definitely need to pull the preamp transistor. It was overdriving my Yaesu FT727 something terrible. I followed the instructions in Ramsy's instruction sheet and it works like a champ. So as far I am concened they are batting 1000.

>> simple kits which encourage lots of experamentation. <<

Yeah this is something I would like to see more of too. But I guess this whets your appetite then you can go from building a kit to building projects from magazines to experimenting on your own.

>> I've had fairly good experience with Jan. <<

This is my first order with them and I must say I was surprised when she told me that it would be 2-3 weeks before I would get my order. I was under the impression they had bins of crystals made up already and it was merely a matter of taking one from bin A and one from bin B. Anyway, I am anxious to get them and get on the air. That ham friend of mine made his first CW contact this last weekend with a fellow from California ... running 100W! I'd love to show him what QRP can do with a couple of watts. But I'll probably need a beam before I make any contacts like that.

Now, that is more like it. I agree with everything you said with the single exception of the analog circuitry doing the Hilbert transform. Indeed, you are of course, absolutely correct about the narrowness of the frequency region where a 90 degree phase shift will occur with my simple example. I guess it is all a matter of opinion as to which is the easier, better approach. I find with analog circuitry that repeatability is always a problem that is mostly lacking in DSP designs.

No, the Parks McClellan does not generate a filter with every other tap zero if you ask it to do a Hilbert transform. You obviously have the Loncast algorithm down pat in that you use low pass filters, which it does a great job of designing, and then rotate them up and down to the appropriate positive and negative frequency to get a real filter. I also follow this approach. The filters are better.

The real point of my submission, is that with graphical interfaces, and the like on filter design programs, generating working code, very little has to be understood about the actual workings in order to do some DSP design. This leaves an unsatisfactory feeling of course, but it is a way hams have done design work in many areas for many years. In addition, I felt you were a little too harsh on DSP. Hams have very little room for truly innovative experimentation in radio anymore OUTSIDE of software. With integration producing FM, SSB receivers and transmitters, I believe that DSP will give back to amateur radio a way to innovate in signals work again. Hams are absolutely incredibly ingenious, and on that I am sure we can agree.

Bob

I know of several folks who use omni antennas with the Microsats. Indeed, N5BF, held an AO-16 session the other day and commented that he managed to do everything he wanted to do on the bird (he is a command station) including loading bulletins, downloading messages, getting directories, but that he thought it was a little slower than usual. He then noticed, after the pass, that he was on his J-Pole. I will give this caveat, if you have 20 guys, all running 25 watts into directional (10 dB gain) antennas, trying to access the satellite, you are going to lose. If everyone would use omni's, all people would be able to get in, if they do the job correctly in installing the omni antennas. Jan King and I are both regularly using Discones to copy the birds. It appears to be a good antenna for this kind of reception. Jan reports he is able to get a copiable signal from the AO-13 beacon with it as well. I copy weather satellites with both omni and directional. While the signal to noise ratio improves with directional (less `snow' in the image) the omni DOES work. I encourage you to try. If you have an r7000 and discone, what can it hurt to try?

The word going around is to observe the IARU Region 2 bandplan. I know several ops who are continuing to observe the American bandplans "to be safe". The whole thing is still pending some clarification from DOC.

IMHO, bandplans per se are good things; I myself prefer voluntary rather than legislated ones. Do _you_ wait for the "Walk" signal at 3 am when nobody is around? There is some room for individual judgment, after all.

There is no on-off switch, because the current draw is almost nil. When the batteries are inserted the first time, it comes up with an "OK" in Morse, but this is via the monitor speaker only, and is not transmitted at the keyer output.

What's "tank coil tubing"?   How would you like to lay out some radials for me? The "soil" is decomposed granite! (Hi Hi).

Re: tank coil tubing

The stuff I have is about 1/8" o.d., with enough i.d. for at least #18 wire. Your mileage may vary. Almost any small-diameter copper tube will do. I found mine in some tank coil stock salvaged from an old amplifier.

The soil in Ft Collins is mostly clay, but all you really need to do is get the grass roots to grow over the radials and keep them from jumping into the lawn mower. Decomposed Granite, eh ? Yuk. You need a jack hammer, my friend. :)

Re: horizontal loop

I described this awhile back. For starters, look up the "Loop Skywire" in the ARRL Antenna Handbook. My application, which called for a "stealth" antenna (covenant problems), allowed 40 meters of #25 enameled copper to be strung up in an equilateral triangle at about 27', using the rooftop peaks as supports. I feed it with #16 600 ohm twinlead into a balanced tuner.

Since the feedline is the most visible part of the whole antenna, I may change that to use transparent 300 ohm twinlead. Anyone know how well the garden variety transparent stuff holds up under UV ? I've fed 100 watts into the transparent stuff, without any SWR funnies.

The wire broke on a windy day (no bungie cord), but I tied off the free end at 7' until spring. It still outperforms the Butternut on 40 meters (and presumably 80 meters as well).

I haven't started any fires, so #25 "stealth" wire seems empirically adequate for the 100 watt level. I suppose I could compute current densities on the surface of #25 vs #18, but that seems like too much work for a $5 antenna.

Perry / KF0CA

>(No one has ever asked to take a harder written element after failing an
>easier one, though.)

I don't know what the official VEC policy is, but here's how they do it in Sunnyvale:

1. You pay a fee, (was $4.95) and you will out the Form 610 that they provide to you. If you are upgrading, you also need a photocopy of your current license, or a certificate from a previous testing session that proves that you passed one or more exam elements. You must also bring a pen and a pencil, and optionally a calculator. They discourage you from bringing anything else. ("Leave your HT in your car.") Form 610 asks if you wish to change your current call sign.

2. The written tests are first. You automatically receive the written tests that you have yet to pass in ascending order of difficulty. After you complete each test, they are graded. If you pass, you have the option of taking the next level of test. If you fail, you are NOT permitted to take any other written tests.

3. The code tests begin about one hour after the written tests begin. People may still work on written tests during the code tests, as the code is given in a separate room. The 20 wpm test is first, followed by 13 wpm and 5 wpm. They usually have several tests at each speed, so everyone who was working on written tests has a chance to take a code test. If you fail a code test, you may take the next slower test.

4. In the code testing room, you receive a pair of headphones. There is a 5-minute warm-up, followed by a series of V's, and then the actual test begins. After the test, you take a multiple choice exam with questions like:

What was the RST?	KK6MY DE	QTH is Canton ...
a. 599	a. W1AW	a. OH
b. 589	b. WA1W	b. GA
c. 578	c. W1AU	c. ON
d. 499	d. W2AU	d. WA

5. If you pass the code, you are called up to the front of the room, and they give you a certificate that indicates which elements you passed. If you hold a current valid license, you may use any new privileges immediately. If you do not, you will have to wait about 4 to 6 weeks for your license to come in the mail, and you may not operate until it arrives.

That's how Sunnyvale does it. You should call up your local VEC and ask about their procedure, as it may differ from this one.

I don't understand the problem. Currently 1A is presumed with a Novice license, so passing 3A gets you a Tech license. Well, if a Novice upgrades after 2/14, why can't the VE accept the Novice license as proof of completion of 1A and issue the required CSCE?

Or am I missing some salient point?

"Ricebox" is intended to be a derogatory term aimed at a particular
nationality. This, to my mind, is "racism."   It doesn't offend me,
and I'm glad that as an Asian person, you're not offended either. (you're
not Japanese, though ...)   However, if I were Japanese, I certainly
would be offended. What if I called a product from Taiwan a "chink-box?"
Would you still have a "sense of humor?"

Does anyone have a 450-470 Radius M214 working in the 70cm band? I know of ways around the software programming with other Motorola radios, but have never owned/programmed a Radius.

I understand that due to marketing decisions the standard MaxTrak software sold by Motorola C&E doesn't program the Radius equivalent.

Suggestions? Comments?

We have an information net, THE 76 NET, which meets at 9pm Sundays on 146.76 (down 6) in Greensboro, NC. We're trying to be the "Ham Welcome Wagon" for the area as well as to focus on ham events and activities of interest. If anyone wants some ham news publicized in the Greensboro area, such as a hamfest within striking distance of Greensboro drivers, send me the news and I'll put it on the net.

>220. Either Yeasu was thinking big about more RF modules, or the display is
>common to a number of their rigs.
>B.

Bob,

Go look at the front panel of the FT767 HF rig...this ought to confirm
your suspicions ;-) In fact, the 767 can accomidate two external
modules just as the 736 can...oddly they only advertise it working
with the 2m and 440 modules.

Usually, they will still conduct the transaction. Signs tend to be
little more than deterrent theory in action.

The reason is fairly obvious: The more $100 bills a business has to
take in, the less change they are likely to have on hand for customers
who pay with $20s and $10s.

Hello, again. In a couple of months, if I can afford it, I am going to
try and purchase the Yaesu FT-470. To aid my purchase, could the readers
of this journal please send me directly their opinions of this model.
And, could you also please send me whatever mods you know of for this

model.

Thank you very much in advance.

Please e-mail to: sehrlich@lynx.northeastern.edu

Since when do true discones have a vertical element? If RS' discone has a
vertical element, it must be some short of mongrel kludge.

doesn't FM take up a lot more bandwidth?...we are much more limited in bandwidth on lower frequencies. Also, it was recently explained to me that there is much man-made fm interference below 30mhz...

Preamps can indeed be switched via DC on their "output" port. However, you must be careful. Most RF relays are just too slow to get the preamp out of the way before TX RF gets there. This was the root of my comment about investing in GaAsFETs - I found out about slow relays the hard/expensive way. In the end, I opted to key a sequencer that keys the preamps then, later, keys the rig. Gotta keep that hand microphone locked up because it keys the '736 directly, eating a GaAsFET every time. T/R switching in the '736 is FAST.

By the way, I don't use PIN diodes for preamp in/out because I often run lotsa watts, and PIN diodes are lossier than relays at VHF/UHF.

I got it Friday. Think I paid too much for it, though. After looking it over (had to open it to tighten some connectors), there's about $250 worth of electronics in there...one low density analog ckt board with all the scope stuff on it and a small metal box which is the add-on BS-8 panadaptor. The $450 + $120 that AES asks for the pair is exhorbitant (IMHO).
I'm happy that I bought it, though. The BS-8 works well, although it does drift quite a bit as it warms up for the first 10 minutes. It's a simple unit and the display is a bit small. Not high-tech at all and I think, for the price that's asked, a bit below Kenwood's standards.
My thanks to those who sent comments on units they owned, especially to Bob Parnass for his article (I also own an R-7000). I'm glad to say that the information you all sent helped me to know what I was buying & to decide that I really wanted it. Thanks & 73 to all,
Pete

Sometime back, someone posted a method of fitting an Outbacker with a long tuning stub instead of a short one, and getting resonance by plugging the loading line into the socket for a different band than the one you were trying to tune to. The long stub reportedly came from a Comet antenna or something.

Now Steve Roberts, of Winnebiko fame, wants to get the reported 3dB gain that this modification affords, but the article's long gone.

Please, please, Steve and I would like to hear about this! Please, whoever came up with that idea, email me the details!

Well, they are up front in their magazine ads that the T/R relay comes separately.

I recently bought one of their pre-wired amps (used). It uses diode switching (maybe with a stub as mentioned by another poster) rather than a relay.

I found this on Compuserve. I tried it on my FT736, and it works! I wonder what the other diodes do? Does anyone have a service manual for the FT736?

Fm: Chuck Scott N8DNX 76556,3335

You can modify the 2 Meter section for 141-154 MHZ by adding D27 (not installed in USA version). This is normally soldered to the board but you can easily install it by simply shoving the leads into the connector. The 2 Meter section is the middle board looking into the radio from the top. The connector (J09) is the large one on the right side of the board, half way back. You want the cathode (striped end) of a small signal diode in pin 7 and the anode in pin 4. Pin 1 is toward the front of the radio.

To receive over a slightly wider range, place the SAT switch in RX mode, press ENT[D] then enter a desired frequency and press ENT[D] again. You can enter any frequency from 100 to 200 MHz this way. Unfortunately, the synthesizer does not actually cover that range. As far as I can tell the bottom end is about 138.5 (not quite the 136.5 needed for the weather sats). The top end is about 155.6. You can't perform this stunt with the normal (non-satellite) VFO's. Also, once a frequency is entered in this way, it is possible to tune toward the normal range but tuning away will place you back in the 141-154 range. Using the same method yields aprox 220.0-229.5 & 423.0-454. You may store these frequencies in the SAT Memories.

Chuck

It is fast becoming obvious that everyone has a "standard" 12 vdc connector. So, repeating something I have heard before "standards are great, everyone should have one" :=)

Ah yes Available but modified for max profit I assume. WARNING no vertical
element! No thanks, I prefer the entire antenna!
I bought the one from Heath (Icoms has an N connector i believe)
They are all versions of the diamond discone, so, might as well
buy it from them, instead of a 3rd party. Mine even came with 50ft of coax!

Don't get me started, Im trying to figgure out how to restore the recording
jack on the dx-440 that RS decided i didnt need so they could make .10 more
per unit. I wish they wouldnt do it, we'd probably gladly pay the .10.
Ofcourse this is purely an opinion, your thoughts may vary... 8-)

Let me preface this by saying that I have absolutely NO experience whatsoever in the HAM radio arena other than a degree of facination and occasionally listening in as several of my friends enjoyed their radios.

Having said that, I know that HAMs tend to be very friendly and helpful folks, so I will throw my question (request?) at you in the hope that perhaps you can point me in the right direction or offer some suggestions. Thanks, and be kind to my mistakes!

Now, to the issue at hand. I have a friend who is heavily into HAM and is searching for some software for the Amiga 1000 that would allow him to use it with his radio (at this time I can't recall exactly what that make and model of his radio is... nuts ... well at least I know that it has the necessary port on it and mentions that ability to make such a connection in the manuals) for RTTY or any of a number of other things he mentioned that I didn't quite follow.

I realize this request is sketchy, but if anyone out there in net.land knows of any such software, of perhaps an FTP site where something like this might exist, or even any tips or pointers on how one might go about writing such software, I would be most thankful! If possible, reply by e-mail to the address below, as I don't generally read this newsgroup.

Thanks!
A.J. Fuller

In a recent posting, Randy Hall asked about his grid square. Randy, 39.2167 N, 121.1333 W works out to grid CM99KF. In the contests, as well as day-to-day exchanges, only the first four characters are used; everyone will expect CM99 from you.

Have fun in the contest!

P.S. How did you get your lat/lon down to the 4th decimal? No map that I have permits that sort of precision :}

Hi folks,

I'm not entirely sure if this subject will be well received on these newsgroups, but I have a feeling there are alot of knowledgeable people out there ...

I am interested in doing telemetry from a moving go-kart (it's not a go-kart, really, it's a race-kart) to a personal computer. I would like to do real-time data acquisition of rpm and engine temperature information at a rate of up to 10 readings per second. The error in of the transmitted readings should be 1% or less (say, 7 or 8bits). The results will be displayed on the computer screen in the form of graphics gauges and bars.

An important design consideration is that the kart itself needs a very light transmitter and associated electronics that can run off of a light battery pack. The transmission distance should be up to a mile or so. Ah, yes - one more thing: this will be used in Canada where the airwave traffic is considerably less than here in the US.

My questions are many and varied:

- What (legal) frequencies are available to me unlicensed?

- What (legal) frequencies are available to me licensed?

- Should the digital encryption be done on the transmitter side or should the transmission be sent as analogue data and digitized at the receiver? ASCII? PCM? FM? SSB? ???

- Has anyone out there ever done anything similar to this?

Thank you in advance,

Andy

>I am thinking about putting up a 1.2GHz repeater. From other people who
>own repeaters on this band I have some specific questions:
>
>- What antenna do you use?

I have used the LARSON fiberglass-coated omni outside for 3
years without problems

>- What is you elevation of you system?
>- What kind of coverage do you get?

The repeater had been operated from the John Hancock center in
downtown Chicago (93rd floor) for about a year. The range in the
clear approached 45 miles to an HT (with portable antenna, 1watt
Icom 12AT) over clear paths and reliable to 10 miles over
occluded outdoor paths. We noticed a pronounced seasonal
variation of coverage due to decidous trees.

The repeater is now located in Batavia, Illinois (38 Miles
due west of downtown Chicago) at 125 HAAT and the coverage
is about 10 miles. A study of a proposed site using topographic
maps and earth-curve charts of the radials of interest will
provide a very accurate prediction of coverage.....

>- What do you use for the repeater radios?

The repeater is a modified ICOM , one of the first sold. The
manual I got with it was *USELESS* ie: the freqency settings
for the DIP switch was not to be found (its synthesized). ALSO,
the repeater controller, IDer is PROM controlled...no info AND
their software is poor. Other than that not to bad for the
the $1100.00 price tag a few years ago. But I doubt that I
would spend the $2700 for one nowadays....

>- Do you use a Duplexer? What brand?

When we had the luxury of 75ft of Horizontal spacing (at 1000ft
HAAT) at Hancock, we didnt need a duplexer. At our present site
we have started using a WACOM duplexer (worth the $525.10)

>- What is the output power of the repeater?

10 watts, continous

>- What type of feeline are you using and what is the length?

Andrews 7/8ths inch Air dielectric, 135 feet

>Thanks in advance repeater owners!

E-mail me at the adr above for more specifics. I have found
1296 FM to be fun, Not as active around the Chicago area as
SSB/CW, but there are now two are repeaters... the other
(KD9FA) is at about 700 ft HAAT in downtown Chicago with
WIDE coverage similar to what I found from Hancock.

> Do they give the 5,13,and 20 WPM code exams as multiple choice ?
> This should make for a lively debate here.

When I took my tests from the ARRL VEC not long ago, there were 10 questions; but they were not multiple choice. The questions were in the form similar to "What aniversary did the sender just celebrate?", "What was the call of the sender?" There is a small space for you to enter each answer. You were warned to be precise. I.e., if OH was sent, an answer of "Ohio" is incorrect (so is Finland, for that matter :-).

If you can't get 7 out of 10 questions right, the VE then looks for a equivalent-minute of solid copy (solid means that, all punctuations have to be exact).

Even with that, a lot of guessing is possible. For example I copied something like "KLM MONO????ER" and the question was "What kind of KLM antenna was the sender using?" Heh, doesn't take much to guess, if you'd evesdrop on enough QSOs.

Another hint to those taking the tests: both calls are sent both at the start and at the end of the QSO used in the test. So you have two chances to copy them. You can just about anticipate it and copy the first half of the call the first time they occur and copy the second half at the end of the QSO. Also, they love to throw in /-something e.g., W1AW/4. Make sure you anticipate that and don't get your rythms all thrown off in the nervousness of the moment.

You're right. I can't remember any time in the last 40 years that there was
no voice operation on 160.

BTW, before VHF FM came to dominate, 160 meter MOBILE was very popular and
amazingly effective considering obvious antenna problems.

You're both wrong. "Riceboxes" or "Rice Krispies radios" started out as a term of derogation of the USERS of those nice compact solid state VHF FM radios from Japan. They were 'appliance operators' who took the 'easy way out'. REAL hams used 600 pound tube Motorola radios they converted themselves from commercial surplus. Indeed, in the early days, these were called taxicab radios.

I am thinking seriously about putting up a 160 meter rhombic at my shack. Is there anybody out there who has experience with these antennas?

My understanding is that the feed-point impedance is 600 ohms or so. I would imagine that 600 ohm feedline would work well from the antenna to the shack, but once inside the shack I need 50 ohms. Does that mean that I need a 12 to 1 balun? If so how do I "make" one (I'll buy one if I have to but I want to "learn" something)? I have the ARRL handbook, Antenna compendia 1 &2 , as well as the antenna matching book but they don't address this problem completely and I want to get this antenna up before winter is over so I don't have time to "school" myself on the fine art of matching.

I'd like the antenna to be run as an all-bander and this should be possible with a tuner (am I wrong?).

The terminating resistor, required for omni-directional operation, should be the same value as the feedpoint impedance. Does this mean that I need a 2KW 600 ohm resistor? If so where do I find one?

I live in an old farmhouse with lots of room to put up this antenna and I believe this could be my once in a lifetime chance to work such a monster antenna. Any help you can give will be greatly appreciated.

thanks es 73

I am surprised to learn that Drake chose to make the large pin the hot one
on their 2-pin Cinch-Jones connector. That is the most dangerous choice.
While it is impossible to mate such connectors backwards if the the
connectors are both aligned face-on, it is possible to insert the small
pin of one into the large pin of the other, if the connectors are
ofset sideways (and they are not of the locking or threaded variety).
This can happen in poor light, or when reaching behind the rig, etc.
If the large pin is hot, this results in a short circuit.
But if the small pin is hot, nothing happens.
Clearly, making the small pin hot is the better choice.

Ok let's see . . .

In the ARRL (oh no not them!) publication "The FCC Rule Book" chapter 8 Emissions: Modulation, Signals and informiaton. they write:

"To find out what is permitted under the new emission designators, start by looking up the definitions under 97.3(c). For CW and test emissions, check 97.305(a) and (b), respectively. For other emission designators, check 97.305(c) to find the bands where these emissions are permitted, along with any restrictions and/or additional modes authorized for specific bands, which are located in 97.307(f). The new rules provide new latitude for the experimenter,
while preserving the traditional demarcations between RTTY/data and phone/FAX/SSTV operation in the HF bands."

[taken from page 8-1]
So from the new definitions in part 97.3

"(5) Phone. speech and other sound emissions having designators with A, C, D, F, G, J or R as the first symbol; 1, 2, or 3 as the second symbol; E as the third symbol. Also speech emissions having B as the first symbol; 7, 8 or 9 as the second symbol; E as the third symbol. MCW for the purpose of performing station identification procedure, or for providing telegraphy practice interspersed with speech. Incidental tones for the purpose of selective calling or alerting or to control the level of a demodulated signal may also be considered phone."

This means that FM (F3E/G3E) is ok to use anywhere "phone" operation is allowed. provided that 97.307(f)(1) & (2) are followed:

(1) No angle-modulated emission may have a modulation index greater than 1 at the highest modulation frequency.

(2) No non-phone emission shall exceed the bandwidth of a communications quality phone emission of the same modulation type. The total bandwidth of an independent sideband emission (having B as the first symbol), or a multiplexed image and phone emission, shall not exveed that of a communications quality A3E emission.

I guess that about covers it and Phil was right! (oh my!)

I have regularily monitored AO-13 beacon and even the strongest CW and
SSB stations with 50 cm long piece of vertical copper wire on a ground plane.
    My friend worked the Microsats with two 1/4 lambda GP's plus
preamp at the base of 70 cm GP. It indeed succeeded best when the birds
were over Siberia and did not see central Europe...
    I have also worked many RS Mode-A QSO's from a car using only 1/4 GP's.
Of course the performance is better if you use J-poles.

>image) the omni DOES work. I encourage you to try. If you have
>an r7000 and discone, what can it hurt to try?
Yep, try and you'll be surprised! But keep the feed lines short and use
low loss cables or use preamp as near as possible to the antenna.

Kaitsu

>
>Huh? It is only powered up when you change the batteries.

Power-up reset circuits protect against voltage spikes that occur at contact closure (whether through a switch, a connector insertion, or by battery installation). These are frequently called "debounce" circuits, and may have a time constant of a couple hundred milliseconds. Digital stuff is much more sensitive to this "noise" than analog, because internal gates and flip-flops can assume unknown states due to the voltage fluctuations. If this should occur on power-up it is possible for a circuit to "lock up" and not accept any further inputs; the only cure being to remove power and start over. Far better to have some sort of a reset: either internal or easily-actuated manual method.

Those who build light-powered digital circuits have an entirely different problem. Rather than with spikes, they must contend with a slo-o-o-w rise time of the power that can occur in dim light or when the solar cell is exposed to a light source slowly. This slow rise time can also cause internal circuits to lock up. That is why you see an "all clear" key on almost all light-powered calculators.

It has finally happened! I have updated the email callbook server at "callbook@sat.datapoint.com" with the December 1990 FCC database. I posted the help file a few days ago, so I'm not going to post it here. If you need help, send a single line with the word "help". If you have problems/questions, send mail to "callbook-help@sat.datapoint.com"

73/Lee, N5LYT

Btw, there are 501,906 calls in the database.

Weird. I could understand "We cannot MAKE CHANGE FOR $100 bills" but
refusing to ACCEPT them seems to violate the concept of legal tender.

What about vending machines that only take certain denominations
of coins?

Dear All,

A few dumb questions!

1) I come to the USA regularly (my parents live there), and have always got a reciprocal license up till now. It's free, and grants Extra privileges (sort of) for my UK 'A' license. I've vaguely been thinking about getting a *real* license (an Extra, of course! :o). There's a VE programme here, so sitting the exams isn't a problem, *but*, how do I find out what to learn? (Yes, I know I probably know it all already, but there's got to be some differences). Where's a good place to look? This "element 1A", etc., stuff baffles the crap out of me. (We only have one exam for everybody.) I assume the ARRL publishes a book with the curriculum? What's it called? (Oh Ghod, I'll have to learn Morse Code *again*!)

2) I've always borrowed a US spec 144MHz HT up 'till now, but I would like to buy one. I'm not bothered about zillions of features, or dual-banding, but I would like one that is easily switchable between UK and US specs and that is reasonably small and not unreasonably priced. Does anyone have a recommendation for a rig, and where to buy it from?

3) I shall be spending all of this June in California, initially in LA, but mostly in and around the SF area. It might be easiest to buy the rig on arrival. Any recommendations for a good store? (I'll be staying in Manhattan Beach, initially).

Also, is there anything else in the ham line worth visiting in LA/SF and points between? I suspect that most things will either be too far away, or at the wrong time, but it's worth asking.

4) And finally, not a question, but a comment. What a sensible idea on the part of the FCC to give you a codeless license. Approximately 50% of hams in the UK have codeless licenses, and I would say that almost 100% of new entries pass the exam, get a codeless license, learn the code and upgrade to a "with code" license.

73,

Hugh.

This is nonsense (as I think the poster realized), especially if you have metal hubcaps. It's amazing what people will believe.
Along the same lines, there used to be a company advertising in Road & Track, an absorptive paint to defeat police radar. This has a theoretical basis-- if every single conductive part of the vehicle were coated with space cloth, with proper spacing between the cloth and the conductors, it's RCS (radar cross section) would be dramatically reduced. This would also make for poor radio reception inside the car. However, the advertised application was clearly fraudulent (or governed by hitherto unknown physics) as they said to paint this stuff on the underside(!) of the hood.
Intuition suggests that the hood of a car has a relatively small RCS, compared to other parts. Radar images tend to be brightest where there are sharp

edges or points. This suggests that the newest generation of very
aerodynamic (i.e., blob-shaped) cars have smaller RCS. Also, plastic &
fiberglass body panels will reduce RCS. The quest for fuel economy may
have the side effect of producing 'stealth' cars.
However, reducing RCS will not make you immune to police radar (unless
you can eliminate the echo altogether.) Doppler (speed-measuring) radar
doesn't depend on the strength of the echo, but its frequency. I have
heard of (illegal) schemes involving a transmitter in the car, which
produces a dummy echo, causing police radar to indicate some false speed.

|>2 General-class hams for the test. This may be the reason it doesn't count.
|>
|>AL N1AL

Indeed any test above Novice is done with a 3-person VE team. But that
is irrelevant to the point. Under the existing rules, a Novice gets
credit for part 1A. The fact that the exam procedure was (or rather,
could have been) different is not considered.

So in other words, Jim is right. A Novice license proves you passed 1A,
and will continue to do so after 2/14.

>license.
>

During the Great CW Debate, a leading arguement for retaining the code requirement was that CW filters out bad operaters. The fear was that our ham bands would sound like the CB band if not for CW keeping out the trash.

An arguement in favor of the no-code license was that CW was preventing many otherwise technically competant potential hams from going on the air. The hope was that these folks would flock to receive amateur licenses and increase the amount of experimentation, especially in digital modes.

What is the UK's experience with a codeless license? Have poor operating practices increased since the UK went no-code? Has technical innovation improved? What lessions can the US draw from the UK's experience?

For about $825 you get the tranciever AND power supply. Now, what is
this unit really. Someone told me it was a YAESU. Is this a good rig?
Is this a reasonable price for what is obviously a closeout?
Any information will be appreciated.

The mention of NBFM reminds me that this was somewhat popular during the 50's. I believe the deviation was 2.5KHz. The curious may want to check out QST in that time frame. (Note: this is from reading various texts and editions of the ARRL handbook. I wasn't even born when all this took place :-)

The question that makes me think is: How narrow can one make an FM voice signal? I'd think that NBFM would be competitive with SSB (maybe even better due to capture effect?) if it could be squeezed into a comparable bandwidth.

OK, this ain't really HAM radio, but if anyoneis going to see/hear/find and signal, then decode it, it's gonna probably be a HAM, so if you don't like it posted here, skip it.

I heard fron an individual recently that he 'heard' that this new caller ID on phone services was simply a digital tone burst dropped on the phone line preceding the ring voltage. Supposedly this is standard BELL 202 FSK tones, but I have no idea of the format.

Has anyone heard what the scoop is on this? Is it as simple as BELL 202 tones on the line in a data burst? Does it precede the ring, or does it interspace with the ring? It's gotta come before pickup, as it is advertised as being used to pre-screen calls before pickup.

What about the data format? I realize it is currently only for local CO coverage, but that may expand.

For those worried about interfacing to the line, Radio Shack sells these little recording controls that interface to the line and start a recorder whenever line impedance drops. HOWEVER, the audio stays live at ALL times, regardless of line impedance. Just tie that audio out to a demodulator.....

Is there any kind of interactive requirements for this, or is the data just streamed to the home line???

Inquiring minds want to know (and build a 6801 project!!!)!

Station LY2WW in Vilnius, one of the important links between Lithuania and the
outside world, was captured and destroyed by Soviet troops. At this point the
fate of the operators is not known.

It is feared that the Soviets were alerted to the existence and importance of
this station through widespread publicity on amateur radio nets and
listservers.

BALT-L is itself operating under wartime guidelines. We will not identify
sources for information coming from the Baltic States. We will definitely not
be publicising targets for Soviet reprisals, or identifying radio fgrequencies
for the benfit of jammers.

We can only appeal to everybody handling information on these acts of war
against the Baltic nations to consider their responsibilities for their
actions.

True for the 725, not for the 735. My 735 is nice and shifty, thank you.

btw, a friend who used to work for Radio Shack mentioned something about a junk mail generator computer that compares your street address and zip code to verify the address (and also to obtain a 9 digit zip). Thus, if you like to give them fake addresses so they can waste money sending out flyers to non-existant people (as I do), be sure to pick a real street and use the proper zip code for that street, or the junk mail may never get mailed.

Of course, this makes one wonder if junk mail could be avoided simply by giving a bad zip code. Somehow, I bet not.

How about direct from Ramsey? The address is:

Ramsey Electronics, Inc.
793 Canning Parkway
Victor, NY 14564
716-924-4560

Call them up and get one of their catalogs. I have seen them at bunches of Hamfests, too. I've built some of their stuff and it's a lot of fun!

Initially, that might be true. The point is the writer expressed an intelligent and thoughtful curiosity based on his self-admitted ignorance. He sees ham radio now with the only frame of reference he has - landline computer networking. As he learns more, his understanding of the differences will improve.

> and the article goes on to point out that *radio* hobbyists seem only to

I'm sure he's right. When the Phantasmogorical Packet Machine has been built, it'll have to be used for something just to keep up interest in it. If the only topic of coversation is the machine itself, eventually it will wither away from sheer boredom. If Phil's ideas of the eventual capabilities of it come to pass, there will be more than ample bandwidth.

I see nothing sinister in that. We can learn from each other.

Agreed. And I'm sure the author of the FidoNews article would enthusiastically endorse it, too.

Again, my central intent in the opriginal posting was to refute the notion held be some OF's that the ONLY result of no-code would be an unwashed horde of bandits seeking to transplant into the ham bands their present brand of good buddy smokey patrols and research into which truck stop has the juiciest broads.

>They take offense because it's a racist remark.

Before you lump everyone into the "they" column, some of "us" have a sense of humour too, you know. :-) I, for example, interpret that as a remark on the *products* and not the *people.*

Heck, I have been calling my Omni-V a "Confederate breadbox." I certainly hope it does not offend friends in Tennessee (guess what the "Ten" in "Ten-Tec" stands for). And, yes, after using Ten-Tec, the Pacific Rim would have have to come up with something very much better before I will switch.

MFJ? Very good bargains, but construction and manufacturing quality not up to 1980 or 1990 standards, IMHO. Be prepared to tighten screws and SO-239s, retouch solder joints (or, should I say blobs?) and sandpaper metal interfaces (I could swear that no one at MFJ has ever heard of the term Faraday cage :-). Even an MFJ coaxial switch came with a loose connector, sigh.

By the way, I noticed that much of the manufacturing for MFJ products is done offshore. But, there is still no excuse for them not doing a critical QC pass.

I used to be super-critical of MFJ. I no longer am; after adjusting my expectations and preparing myself each time to do my own QC pass after bringing a unit home from the store.

Just don't expect MFJ equipment to be as bullet-proof as an HP Spectrum Analyser. Afterall, if you flame too much about MFJ and get your blood pressure up too high, you might end up SK like that chap in Benin.

No, they store the entire number (they asked for it, anyway) and use the last 4 to look you up. There is no hashing to it. Searching the last 4 digits is faster than searching all 7.

> But why bother? At least it saves
> them from having to scribble down your name and address every time you
> buy something, given that they're committed to getting that
> information. And they HAVE been committed to getting that information
> ever since they became a national chain. This "last four numbers"

If you are not in the database, they MAKE you give them the info to PUT you in the database. Now that you are IN the database, they can track what you purchase, send you flyers until you turn blue in the face and your recycling bin is full, and SELL your name to other people (like LOTUS?) without your permission.

The hassle is NOT just giving them the 4 digits of your number, but the implications of being in their database at all. And those of us who object to being in their database objected all along.

Well in the sense of the reflector adding intelligence that wasn't in the original signal? There was a problem a few years ago when the US embassy in Moscow was regularly bathed in microwaves. Rumor has it that the Soviets build a resonant cavity into the walls of the building that would reflect microwaves of a certain frequency (I think these are used for testing at airfields). The resonant cavity has a diaphragm which vibrated changing the resonant frequency of the cavity. People talking in the building would make the reflected signal shift in frequency -- frequency modulation.
This passive bug required no power source so it couldn't be found by conventional methods. The Soviets could compare the input to the reflected signal and extract the intelligence from the signal.
Supposedly the Soviets found the design for this device at the US Patent Office among the hundreds of thousands of patents which flow through there..
So here is a case where a reflector was a true transmitter.

Plans for twin-lead J-pole antennae have been posted several times, but I'm confused by a significant difference in some of the plans. In Jim Grubs' plans (see recent posting as well as 5-Nov-90), the twin lead is shorted just above the gap. However, in Andrew Kinsman's posting of 2-May-90 this point is not shorted; this is also the case in the April 1982 QST article (page 43).

So, should or should not one short the twin lead above the gap? Does it really even matter? (please note, I am NOT talking about the short at the bottom of the antenna).

I'd like to interrupt the code/nocode/group rename/radio shack discussion for something that I hope will be useful to some hams.

When I became a ham not too long ago, I needed to make power connectors for a couple battery packs, power in my car, my Astron power supply, etc. Well, it was obvious that what I needed was some "universal" connector that would work for 12 volts and allow me to connect any cable to any power supply. I looked around and the only thing I could come up with was the Radio Shack "pigtails" using the red/black wire and molded plugs. They were cheap and I figured available everywhere so I used those. But not ideal, as they have one exposed lead, and you have to splice them into your cables.

At a ham club meeting a member displayed some absolutely fantastic connectors, and as I understand things there is some effort to get the ham community to standardize on these. The benefit of course is that we can easily swap power supplies. You won't find these at Radio Shack, but a local electronics store with more stuff does have them, as does a local ham/short wave radio store. So with a little luck you can find them too.

These things are red or black plastic enclosures accepting a metal tab that snaps in. They are designed such that they only mate red/red and black/black. Each connector has a small dove-tail on two sides and a mating notch on the other two. This allows you to fasten any number together so not only can you lock two together for a standard two pair cable, you can use 4 together for something like a heavy power supply cable for your HF rig (my Kenwood uses 4 conductors for the 12 V power cable.)

These are from Anderson Power Products, part numbers: Black 1330G4, Red 1330, contact only 1331. Specifications for these are: Current 30 amps, voltage 600, contact resistance 600 Microhms. They come in other sizes for 75, 120, and 180 amps. There are also accessories available, such as panel mounts, which I have in my car dash. Cost is about $0.30 per connector so mating both ends of a two conductor cable is $1.20.

Well sounds like I'm selling these, but I'm not, and don't even make any money on the sales. But I might benefit if I'm ever mobile and need to borrow your power supply!

Note: When you wire these, facing back (wire side), put red on the RIGHT and metal contact DOWN. I put a drop of glue in the slot on side of connector and slide together.

Sorry for the length of this, but it is information I would have liked when I was first in the hobby.

I do not subscribe to this news group so please e-mail all responses to this request for information.

I am looking for the dates and locations of any and all HAM-Fests in the North and South Carolina areas and also within the Virginia area.

Specifically I am looking for Fests that have strong turn-outs of computer hardware vendors.

Thank you for your help!

SB RTTYDX @ ALLBBS $RTDX0111A
RTTY DX Notes 1of3 1/11/91

RTTY DX Notes for week ending 11th January 1991
BID: $RTDX0111A
Part 1 of 3.

One wonders at times if the risks taken by some DXpeditions are really worth the effort. After all, is a new country worth the injury or life of the expeditioner? Too many times have we seen the lives of the participants at risk so that some people can have another country to their credit. I think that it is time that we stood back and said, how much is a life worth? But of course there will always be the person who will pay anything to beat the chap next door, even someone else's life. Think about it.

Our thanks this week go to DJ3IW and the Saar-Pfalz Packet Cluster, I5FLN, I5ICY, I5IGIGQ, JA1BLV, OD5NG, TG9VT, UT5RP, VK2EG, W2JGR and the Tri-State Packet Cluster DX Network. Thank you all for your assistance and information. Incidentally, next week will be my last notes for a few weeks. I have been given leave, so please direct your information to I5FLN at OD5NG or at TG9VT. Again thank you all.

RTTY DX Notes 3of3 1/11/91

RTTY DX Notes for week ending 11th January 1991
BID: $RTDX0111C
Part 3 of 3.

QSL Information:

YS/WD4IFN, Herman, says that the QSLS go to Herman H. Franke, U.S. Embassy, APO Miami, FL 34023 USA.

V73BN says to QSL to his old call of KX6DC.

YA0RR will QSL for RTTY contacts to UT5RP Box 300, Odessa 270000, Ukraine, USSR. Make sure that you hide the return postage.

UV1AT goes to Box 200, Leningrad, 198328 USSR.

UW0FZ collects his cards from Box 140 Uzhno-Sahkalinsk City, 693000

USSR.

UL7LR QSLS via Box 97, Dzhetygara 459430, Kazakh, USSR.

Notes of Interest:

The correctness of the 7 MHz contact with YA0RR cannot be verified at this time, but Romeo has stated that they will be on RTTY as of this Friday 11th, and hope to have a new aerial as well. They are still in Kabul where they hope to stay. They hope to operate RTTY at regular intervals.

F6BJY/TN8 called CQ and then dissapeared on his first effort, but later came up and said that he did not have a legitimate license, but had applied for one, so the usual applies. WFWL.

This bulletin is edited for packet from notes written by VK2SG, and relayed by Tad, KT7H @ N7HFZ.WA.USA.NA.

I'm not sure about the easiness of finding CTCSS as standard in most European HT's but at least my new Alinco DJ-560 Twin Band HT has as standard features CTCSS encoding and decoding (for tone squelch), 1750Hz repeater tone, dmtf encoding & decoding (code squelch & pager), different channel steps (didn't you use 20Khz instead of the 25Khz we do?), fully programmamble offsets, dual receivers (nice with stereo headphones) and many others. I suppose the same unit is sold in US too, since it seems that it's just matter of different default settings in software. Maybe I'll come someday over the pond to test the US compatibility... At least I think DJ-560 is worth looking for even if it doesn't have alarm clock, CAT interface, battery level indicator or SSB (which I haven't seen in any HT yet). At least it's available here now and gives good value for your money especially if you look for twin bands and global usability...

>
>Perry / KF0CA

The 735 has PBT, and an IF notch filter, and a built-in keyer is an option. Icom offers several filter triplet options for this rig. All the Icom filters have excellent shape factors. The widest filter is for FM and is not replaceable. It is always in circuit. There are three choices for high IF and low IF filters available. You can only have two of these pairs in the radio at once. One pair for SSB and the other for CW/digital. I'm using the extra sharp SSB pair and the 500 Hz CW pair. The 200 Hz CW pair is too narrow for my RTTY and Packet work. They'd be fine for a dedicated CW operator. The receiver *is* better and the construction is *much* better. The heatsink design for the transmitter is superb. It really takes some doing to get this radio hot. And the blower is very quiet when it does kick on.

The hardest thing to describe, but the best feature of the radio, is how the control system operates. You really have to sit down and *use* this radio for a while to appreciate how well thought out it is. I've used this radio for six months now and it is the first rig that hasn't tempted me to go back and fire up the Drake R4C to pull the weak ones out of the crud. I've owned Collins, Drake, TenTec, Kenwood, Yaseu, and Icom radios over the years and they all have their strong points, but this little radio has truly impressed me. The IC765, the IC781, and the TS950 may each edge the IC735 out in one category or another, but overall the 735 wins for portablility, and cost/performance, while not sacrificing much in any other area.

It's a rugged *little* beast with a marvelous receiver and a truly bullet proof transmitter as well as the finest control system that I've ever used.
I totally disassembled the radio the day after I got it. It's very nicely modularized and I have every confidence that I can repair it if it ever needs to be fixed. It's compact, but every part is accessible to someone equipped to do modern pc board repair. The quality of the circuit boards and connectors surpasses much of the broadcast equipment that I work on every day. The modules hinge out in such a way that you can get a scope probe on any circuit point without disabling the radio.

I tend to trade radios *a lot* and the fact that I'm still singing the praises of this rig after six months is strong testimony that I think this is a real winner.

Boy, your Sears clerk is the one in the dark ages. Sears has been accepting just about any major credit card, except American Express, for a couple of years now. *My* local Sears store will take about anything that reeks of money with a smile. They also have point of sale scanners and will debit your Instant Teller card if you like. They're serious about stopping the decline in sales that they've suffered. Contact your store's manager and ask why the clerks aren't aware of Sears' two year old policy of taking anything that makes the register go ka-ching.

Would appreciate the assistance of fellow hams in trying to locate a source for a few LM 1881 video line selector IC's. The name and fax number of a firm that stocks them would be a great contribution to the advancement of microwave video technology in the middle east.

Thanks in advance and 73

Our local ARES group standardized on 2-pin Cinch-Jones connectors for
12 VDC power about 20 years ago. These are available at Radio Shack, ham
fests etc and are quite common. This was also publicized in QST several
years ago. The small pin is the hot one, and of course the female connector
is used for the power supply side. Everyone here cuts off whatever DC cable
is provided by the rig manufacturer, and then splices it back together
with a pair of these connectors. That means that all supplies and equipment
are interconnectable.

So you see ham radio from merely a utilitarian viewpoint, as in commuting
to work, or say, the land mobile radio service?

Rescue squads in the DC and Virginia area use the same standard. They
have also standardized upon Larsen-type mobile antenna mounts.

Two-pin Jones plugs are nonideal because they fall apart easily unless
tied or taped. The ones from Radio S*** are made of thermoplastic,
and may melt from too much current.

The ultimate adapter is wire cutters and tape.

>Barry VE3JF
>

Yes. I recently bought one of their 28/220 models. It appears nearly
identical to the Microwave Modules model. Their address is:.

Sinclabs Inc.

Hi, I use the IC-725. I found it is very good for a beginner. Since it has not very special functions and easy to use. And it can transmite form 30KHz to 33MHz if you change the diode of control part. If you want to use FM mode, you must buy a optional for it. IC-725 is enough to beginners and you maybe change rig in the futher, it will be you best choice. The one of all reasons is not expansive. Hope the information is useful to you.

Hi all.

(I think my earlier posting was lost (OS upgrade here) so, hopefully, this is not a repeat.)

I am looking for comments and recommendations for control programs for the NRD-525 receiver (to run umder MSDOS).

I have a couple that I am experimenting with. One is called NRDGUI and looks to be a very nicely thought out job indeed. The thins is, I can't get it to work. I downloaded it from HAMNET on CI$, but it had no docs and it has since vanished completely from CI$' libraries so I can't track down the author. Anyone know anything about this one?

DATACOM - anyone using that?
What's it like?

All suggestions welcome,
thanks,
Lee.

Subject: Club Meetings/Nets in Oklahoma City

Greetings all,

Just arrived in Oklahoma City this evening (all right, 0000Z 14 Jan) with HT and Repeater Directory in hand hoping to make some new friends...alas, it came to pass that the trusty ol' TH-215A forgot to put itself on the charger before I left :-), so it's dead as a doornail. So...while it's on its 14hr revival kick, could some kind soul(s) tell me if there are any club meetings or scheduled 2m nets in the OKC area this week (now until 20 Jan, inclusive)? Thanks much...e-mail replies please, I feel bad enuff putting this on the list.

73,
Jeff Miller WD6CQV/KH6 (uh, temporarily /5)

I am looking for MOD information on the Kenwood TM-941 Tri-band radio.

Supposedly there are mods for out of band operation and also for cross band repeat. I have not been able to track them down so far. If anyone has information as to how I can find them I would appreciate hearing from you.

Thanks;

Paul Israelsen - KB7LJC

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
January 13 to January 22, 1991

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 06 JANUARY TO 12 JANUARY.

Solar activity over the past week ranged from low to moderate. The early part of the week proved to be the most energetic, with Regions 6444 and 6447 providing the majority of M-class flare events. These regions have decreased in flare output over the past several days, yet remain capable of spawning M-class flares. Region 6444 is the largest region on the disk at the present time. Its size is a respectable 4,740 million square kilometers. It encompasses a moderately complex magnetic region classed as a beta-gamma configuration. There are presently 69 sunspots associated with this region, which has remained relatively stable this week. This region could become capable of spawning major energetic flares. It has the size, the sunspot complexity and the magnetic capabilities, but the low levels of flare activity which have been observed since it's appearance on the east limb would seem to indicate that its present inactive state will continue. The penumbral extent of this region is impressive when viewed in white light. This region will be observed closely for signs of increased flare production.

Region 6447 is the next-largest region on the disk, but is dwarfed by Region 6444 by 3,870 million square kilometers. However, it has produced some frequent C-class flaring and has now become the most prolific flare producer currently on the solar disk. It consists of 29 sunspots arranged in a Beta magnetic configuration. This region has changed very little over the past several days. No significant growth or decay has been noted.

The intense stratospheric warming continues over Europe. The warming is associated with a strong anticyclone. The warming is now spreading from Europe towards the east. The stratospheric warming could begin to weaken this week. The stratospheric warming alert should continue, however, for the next 4 to 7 days.

Geomagnetic activity became more active this week in what is thought to be a response to an equatorial solar coronal hole which passed the central meridian earlier this week. Brief periods of low-intensity minor storming were observed over high latitudes on 12 and 13 January. Some middle latitude locations also experienced brief periods of minor storming.

The increased solar corpuscular emissions spawned auroral activity that was visible over high and northerly middle latitudes on 12 and 13 January. Activity was moderate over high latitudes, and became mostly low with occassional periods of moderate activity over northerly middle latitudes. Also of special note were the two chemical releases which produced small artificial auroras on 13 January at 02:17 UT and 07:05 UT. The next chemical release will be a Barium release and is scheduled to occur at 04:12 UT on 15 January.

HF radio propagation conditions have been very good this past week. Enhanced ionizing solar radiation over the past week has enhanced MUF's by as much as 20% higher than expected. However, the early to mid part of the week contained occassional disruptions due to solar flare activity on the sunlit side of the earth. High latitudes experienced degraded conditions due to the increased auroral and geomagnetic activity on 12 and 13 January, but conditions have quickly returned to normal.

VHF propagation conditions this week were normal. No significant periods of enhanced or degraded conditions occurred this week. Some 6 meter openings may have been possible over some locations this week due to the enhanced MUF's.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to remain low to moderate over the next week. Regions 6444 and 6447 will continue to produce C-class and isolated M-class flares. Region 6444 could also produce a major flare if it begins to develope or decay over the next week. These two regions are the only two regions capable of producing any significant activity. They will be observed closely for signs of developement. The solar indices should begin to fall this week, having peaked at the predicted level of 220 on 10 January.

Geomagnetic activity should return to quiet levels by 14 or 15 January over most latitudes. Activity should remain predominantly quiet with occassional unsettled periods throughout the coming week. No storm periods are anticipated, barring any significant solar activity.

Auroral activity will likewise return to dormant levels over the coming week. No significant activity is expected over low, middle or high latitudes this week (again, barring any significant solar activity).

HF radio propagation conditions will be very good early in the period, with excellent potential for DX. This potential and the quality of DX will decay, however, as the week progresses due to the expected decline of ionizing solar radiation. The chemical releases will have no effect on the quality of HF propagation conditions. However, any curious anomalies should be reported to std_oler@hg.uleth.ca.

VHF propagation conditions will be normal this week. No significant opportunities for DX are expected this week. SID enhancements may be noticed over sunlit areas, particularly during periods of M-class flaring. SID enhancements will be short-lived, and of minor intensity unless major flaring develops. No auroral backscatter communications will be possible this week.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 13 JANUARY

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6437	S16W75	096	0000	AXX	00	001	ALPHA

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

SPECIAL SOLAR TERRESTRIAL BULLETIN

Artificial Aurora Alert

14 January, 1991

/\/\/\/\/\/\/\/\/\/\/\/\/\

Successful chemical releases were accomplished on 13 January. The first release was a Barium payload that was released at 02:17 UT. The second release occurred later that evening at 07:05 UT. This second release was a large Lithium payload.

The first release was widely viewed throughout the continental U.S., Mexico, Central America, South America, Carribean, and Canada. The color was greenish, became moderately bright and attained a size near the size of the full moon. It then began to fade somewhat and formed a small curtain-type auroral pattern. It remained visible for between 5 and 10 minutes.

The second release was not as easily seen as the first apparition. Lithium produces a red colored aurora that does not remain visible as long as the Barium. Although this event was visible at the same locations as the Barium release, the intrinsic color, different location and shorter duration of the Lithium release prevented many people from viewing this latter event. For those who missed the Lithium release and would like another chance to view one, there will be two more releases of Lithium over the next 10 days or so. Bulletins will be posted when the times of the releases are known.

The next chemical release will occur on 15 January at 04:12 UT. This release will be a Barium release. It may be useful to note that these releases become visible at the times stated. You need a dark observing site to see them best (particularly the Lithium releases). Be careful when converting these times to local time. This next event occurring at 04:12 UT on 15 January does NOT occur on Tuesday evening. It occurs on the evening of 14 January over North and South America since the end of one UT day and the start of another occurs in the late afternoon/early evening hours. So, to be clear, this Barium release will occur at 12:12 am (12 minutes after midnight) AST, 11:12 pm EST, 10:12 pm CST, 9:12 pm MST, and 8:12 pm PST.

Again, for direct information regarding the status of these releases, call the number: (205) 544-5356.

I have used (and recommended to others) midget Hubbell Twist-Lock 2-pin connectors which are rated at 15 amperes. This connector is robust, is clearly polarized, will *not* accidentally come apart, has no chance of accidentally being connected to 120 VAC, and is relatively inexpensive. This connector comes in several styles: cord male, cord female, panel-mount male, and panel-mount female. In addition, there are rubber boots available for cord connectors to assure raintight integrity. There are furthermore rubber end caps for use with the rubber boots so as to protect stored cables from water and dirt.

While one cannot find such connectors at a Radio Shack, they are readily available at any industrial or wholesale electrical distributor. Please bear in mind that I am referring to the "midget" Twick-Lock series, whose connector bodies are somewhat less than one inch in diameter.

> The ultimate adapter is wire cutters and tape.

To solve the most common "adapter problem", I have Twist-Lock adpaters to both male and female cigar lighter "connectors".

Since it probably won't cancel before everyone reads it: I posted an article questioning AM/SSB on 160m... looks like I'm having more trouble than I thought distinguishing colors on this chart. (Yes, I've scheduled an eye exam. This worries me a bit....)

ANS & KEPS NOW FOUND ON PACSATS

HR AMSAT NEWS SERVICE BULLETIN 012.01 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

AMSAT News Service (ANS) Bulletins & Keplerians Available On PACSATs

With the commencement of full-time BBS operations on AO-16 and UO-14, radio amateurs now have a highly reliable way to receive the ANS bulletins and orbital elements as quickly as they are available. Each weekend when Courtney Duncan (N5BF) the AMSAT News Service Managing Editor completes his review of the bulletins and orbital elements for the upcoming week, he will upload them to the AO-16 on the next available pass and set both items for a three day broadcast. ANS has been carried on UO-14 BBS's in this fashion for several weeks. Those who are able to monitor PACSATs will then be able to capture the bulletins and keps easily without having to depend on a tenuous HF packet link or worry about busy signals from a VHF packet or landline BBS. Because of the orbit of the PACSATs, global coverage of the world makes it possible to see a PACSAT pass at lest six times/day from most locations. Join the many new PACSAT users who have found that the fastest way to move traffic and receive the latest news about what is happening in amateur radio is through the PACSATs.

For more information about how to receive the ANS bulletins and keps via the PACSATs, contact N5BF on PACSAT-12, aka AO-16 or @ WB6YMH. PACSAT user software is available from the AMSAT Software Exchange at (301) 589-6062, or can be downloaded from the DRIG at (214) 784-3748, or from CompuServe's HAMNET.

AMSAT PRESENTATION TO FCC

HR AMSAT NEWS SERVICE BULLETIN 012.02 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

AMSAT Presentation for FCC Staff Well Received

The U. S. Federal Communications Commission Private Radio Bureau hosted a presentation on the Radio Amateur Satellite Service, given by several AMSAT-NA leaders on Friday, January 11, 1991 in Washington, D. C. About 45 FCC staff members and interested amateur radio operators were present.

The presentation, led by AMSAT-NA President Doug Loughmiller (KO5I) and Vice President for Engineering Jan King (W3GEY) featured details on current AMSAT projects and goals, amateur satellite history, the current state of the Radio Amateur Satellite Service, and the role of the Service in such areas as public service, scientific research, education, disaster and emergency preparedness, and technology development.

An excellent video tape edited by Steve Smith (N8DEZ) with assistance from Eric Rosenberg (WD3Q) and Dick Daniels (W4PUJ) was included as was a slide presentation prepared by Greg Hine (WT0M) and AMSAT-NA Vice President for Field Operations Jeff Wallach (N5ITU). AMSAT-NA Treasurer Art Feller (KB4ZJ), AMSAT Past President Perry Klein (W3PK), and other local amateurs were also involved in preparations for this landmark presentation which was well received by FCC staff.

Unfortunately, the electromagnetic noise level in the building was too high to allow succesful direct reception of the DOVE Microsat which was transmitting a message of greetings to the FCC staff that had been uploaded specifically for this event.

This is one of many activities being conducted by AMSAT-NA and the American Radio Relay League designed to increase the awareness of the FCC about the many positive and forward looking aspects of amateur radio as the 1992 World Administrative Radio Conference approaches.

[ANS thanks KO5I for the information in this bulletin.]

AO-16 EXPERIMENTER'S DAY

HR AMSAT NEWS SERVICE BULLETIN 012.03 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

AO-16 S-Band & Raised Cosine Transmitters Experimentation To Begin

In the continuing tradition of AMSAT'S Wednesday Experimenter's Day, AMSAT and the PACSAT command team are pleased to announce the routine operation of AO-16's S-Band (2401.143 MHz) and Raised Cosine (437.050 MHz) PSK transmitters starting January 16, 1991.

Since the operation of these transmitters is currently under ground control, the start and stop of their operation will not occur exactly on Wednesday UTC but will vary a few hours either way. The schedule for the remainder of

January is as follows:

DATE	START TIME	END TIME
16-JAN-1991	23:35 UTC 15-JAN-91	22:36 UTC 16-JAN-1991
23-JAN-1991	04:36 UTC 23-JAN-91	04:10 UTC 24-JAN-1991
30-JAN-1991	01:26 UTC 30-JAN-91	02:32 UTC 31-JAN-1991

While operation of the S-Band and Raised Cosine PSK transmitters is scheduled to be conducted weekly, users are cautioned that these operations may be shortened or cancelled to allow uploading of improved spacecraft software. Watch for bulletins in the BBS and the telemetry text frame of AO-16 for changes to the schedule.

Users are requested to send reception reports and comments for the January operations to WB9ANG: @ PACSAT-12, @ W8BI.OH.USA.NA, or via CompuServe to 74017,2454.

WO-18 STATUS: PART I

HR AMSAT NEWS SERVICE BULLETIN 012.04 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 (WO-18) Status Report: January 8, 1991, Part 1

Chris Williams (WA3PSD) reports that while many radio amateurs spent this past Christmas season either opening up the boxes of brand new VHF/UHF rigs for OSCAR operations or dreaming of opening presents that would enhance their ham shack, Weber State University (WSU) engineers were busily experimenting with the CCD camera iris settings on WO-18. This tedious work is a continuation of the this ardous task started last summer to find the right combination of iris settings for a particular sun-light level. Another difficult task undertaken by the engineering students at WSU at that time was to find a way to tell when to the CCD camera was earth pointing. Thinking about it logically, the students realized that all they had to do to get spectacular pictures of the earth was to just program the on-board computer to look for the following conditions from the solar arrays: -Y solar array brightly illuminated, +Z and -Z solar array currents almost "zilch," and then snap a picture. If one takes a moment to imagine the structure of WO-18, what could be simpler -- POINT AND SHOOT. But as usual, Murphy wins again! Ask any ham. Also, another celestial "monkey wrench" was thrown into what is a very complicated spacecraft attitude motion problem when WSU engineers noticed that something very strange was happening to WO-18: it's Z-axis spin rate was slowing down -- contrary to what was happening on the other MICROSATs.

SB ALL @ AMSAT $ANS-012.05
WO-18 STATUS: PART II

HR AMSAT NEWS SERVICE BULLETIN 012.05 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991

TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 (WO-18) Status Report: January 8, 1991, Part 2

This unexplained phenomenon has caused the WSU engineers to scratch their heads for many hours of contemplation. They feel they have found the answer in a rather ancient NASA document on spacecraft electrostatic charging. However, the engineers are still wondering what all those pages of equations really mean.

Yet despite all these problems, small sucesses are possible in performing the very difficult task of imaging from outer-space using WO-18. By narrowing the iris and developing more sophisticated algorithms to tell the on-board computer when it should take a picture, some very good earth-space horizon pictures have been taken. By experimenting with WEBERWARE 1.0 (WW 1.0), what initially looked liked streaking bright curves across the CRT screen were changed into good images of the earth-space horizon. By manually increasing the "brightness" value and decreasing the contrast with WW 1.0, it was possible to produce some very good earth-horizon shots.

The WSU engineers are still not convinced that they are taking the best pictures possible from WO-18. They remain optimistic that they will find a the right combination of camera iris settings to get consistently good pictures from space. So far there is no evidence to indicate any sort of a CCD camera hardware failure. Also, there is a tremendous flexibility possible for engineers to vary other parameters which can be set in the spacecraft on-onboard computer. WA3PSD likens it to having the capability to being able to twiddle a lot of "knobs" on a TV set in order to get a good picture. There are many more setting which need to be investigated which can affect picture taking.

If you would like to try your hand at "twiddling the knobs" on WO-18, WW 1.0 is a good place to start. Perhaps you can find the right combination of parameters in WW 1.0 to turn those "washed out," overly bright images into something beautiful -- others have. To quote a famous AMSAT'er: "It's only software."

[For more information about how you can obtain WEBERWARE 1.0, contact the AMSAT Software Exchange at (301) 589-6062.]

TO ALL RADIO AMATEURS BT

W0SL Appointed AMSAT-NA Software Exchange Manager

AMSAT-NA VP for Operations Courtney Duncan (N5BF) announces the appointment of Roy Welch (W0SL) AMSAT-NA Software Exchange Manager, effective on January

14, 1991. Roy has been an active amateur satellite user for many years, is an AMSAT Area Coordinator, and is author of one of the first satellite tracking programs for IBM-PC and compatible systems "Orbits."

Roy's appointment comes at an exciting time in the world of amateur radio satellites. Several different types of software including satellite tracking programs, telemetry analysis programs, scientific and educational programs of various sorts, and now pacsat ground station software are handled by AMSAT-NA in support of several different types of personal computer systems. With the assistance of other volunteers specializing in various systems or software types, Roy will be overseeing the AMSAT software process from authors to final production and distribution.

If you have questions about software that AMSAT has available or would like to volunteer to write programs or participate in some other way in the process contact:

Roy Welch, W0SL
908 Dutch Mill Drive
Manchester, Mo   63011

SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

RS-12/13 To Fly Before RS-14/RUDAK-2 According To AMSAT-DL Officials

In what is considered a major suprise to AMSAT-DL officials, RS-12/13 will be launched before RS-14/RUDAK-2. According to the latest information coming to AMSAT-DL officials from the USSR, RS-12/13 will be launched on January 20, 1991. Then about one week later RS-14/RUDAK-2 will be launched! RS-12/13 has been in storage for over a year awaiting an opportunity to be placed into orbit. RS-14/RUDAK-2 has also been delayed over a year. AMSAT-DL officials can only explain these delays from the standpoint of economic pressures and efforts to minimize launch costs. All radio amateurs are requested to stay tuned to the AMSAT News Service (ANS) bulletins for any further information about these OSCARs.

[The AMSAT News Service would like to thank DB2OS for the information which went into this bulletin.]

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 012.08 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule

AMSAT Operations Nets are planned for the following times.Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
19 Jan 91	210	B	1445	WB9ANQ	KA5SMA	Saturday
26 Jan 91	211	B	1830	WA5ZIB	WD0E	Saturday
03 Feb 91	0500	B	0107	N5BF	WB6LLO	Saturday
09 Feb 91	1430	B	0212	KA5SMA	WB9ANQ	Saturday
17 Feb 91	0400	J/L	0175	WD0E	WA5ZIB	Saturday
24 Feb 91	0500	B	0115	WB6LLO	N5BF	Saturday

Roy Welch (W0SL) will discuss his new job as AMSAT Software Exchange Manager and what this means in terms of improved software user support during the 26 January 91 session.

It is the intention of the Operations Net management to have guest speakers approximately every other week to provide up-to-the-minute information on topics of interest (such as Microsat ground station software, AMSAT Software Exchange, and WARC 92). As guest speakers and topics are confirmed they will be published in ANS.

WA3NAN, the Goddard Space Flight Center radio club has begun to retransmit the Mode J/L (Mode B nets will not be retransmitted at this time) AMSAT Operations Nets on 147.450 fm for the Washington DC area amateur community. Questions from listeners can be patched from the club repeater (146.835 -) to AO-13 for the net.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

NEW AO-13 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 012.09 FROM AMSAT HQ
SILVER SPRING, MD JANUARY 12, 1991
TO ALL RADIO AMATEURS BT

The new winter transponder schedule for AO-13 is as follows:

```
 Mode-B : MA   0 to MA 165 | <= If eclipses over-drain battery in
 Mode-JL: MA 165 to Ma 190 |    Jan 10 - Feb 06, B-OFF MA 20-65
 Mode-LS: MA 190 to MA 195 |
 Mode-S : MA 195 to MA 200 | <= Mode B is OFF; no swishing!
 Mode-BS: MA 200 to MA 205 | <= QRP on BS please.  High power
 Mode-B : MA 205 to MA 256 |    wipes out mode S experimenters.
```

Omnis : MA 240 to MA 30 |

This schedule is expected to continue through 25 March 91

The command team requests that you make a specific effort to use QRP on Mode B between MA 200 to 205. This is specifically to help those people who are experimenting with Mode S.

During the Winter, the worst Sun angle (11 March 91) will be -27 deg, resulting in 89% illumination. AO-13 will experience eclipses by the Earth from 11 January 91 to 6 February 91, the longest being 82 minutes (MA 32-53). If battery drain is excessive during this period of time, it may result in Mode B being turned off from MA 20-65 until 6 February 91. AO-13 will experience Lunar eclipses on 16 March 91 (50%) and 14 April 91 (23%).

Magnetorquing operations are complete and the resulting spacecraft attitude of AO-13 is:

BLON = 209.5 and BLAT = 0.7 for 31 December 90

AMSAT-OSCAR-10 appears to be receiving sufficient solar panel illumination to support Mode-B transponder operations. The transponder may be used, carefully, at all points of the orbit except MA 254 - 006 when eclipses occur. If beacon or transponder signals show signs of FMing, users should cease all transponder use immediately. An APPROXIMATION of the spacecraft attitude for AO-10 is :

BLON = 0.0   and BLAT = 2.0 for 19 January 91

/EX

I agree with Peter. All the VE organizations I've been to DO give Novice tests, as well as all other upgrades. However, it is explicitly forbidden in the FCC Rules that VE's cannot CHARGE for Novice tests. With higher upgrades, there is a fixed "cost" to allow the VEC's to help pay for the cost of giving tests (printing and copy costs, etc.). I do not disagree with with "cost", I think it's quite reasonable ($4.95 for as many tests as you can take and pass).

However, VEs cannot charge anything for the Novice 1A and 2 tests. And most don't. (Unfortunately, I've seen a couple of cases where the Novice did get charged....but I don't think it was intentional). If the non-ham takes and passes the Novice tests, THEN wants to continue taking tests, at that time, he must dole out the $4.95, for the upgrades.

Hope this helps clarify this issue.

Sender: news@genrad.UUCP
Lines: 53
```

With all the bashing of Radio Shack, I almost hesitate not to post this..... but I will anyway. On this weekend's ARES net, it was brought up that there are many potential hams coming into Radio Shack, asking questions, but the employees don't know much about it, so can't give much assistance. Therefore, we decided to create a flyer to give to local Radio Shack stores, to put up "somewhere" or just to give to customers who ask questions. I've enclosed the ham flyer that we're gonna give to Radio Shack. Any comments from other hams? Have others done something like this before? If so, what kind of response did you get? If not, why not? Just curious!

Diana

WOULD YOU LIKE TO BE A HAM?

* Do you like to build things?
* Would you like to talk to someone on the other side of the world?
* Would you like to help with communications in a parade or walkathon?
* Do you like to experiment with computers?
* Are you a "stay-at-homer" but want to talk to someone far away?
* Would you like company on the drive to work?
* Did you know there is now an amateur radio license that does not require knowing Morse code?

All of these things are possible with Amateur Radio. Age is no object, anyone who can pass the tests are welcom. And we will help you pass the tests, with classes and Elmering. There are many handicapped persons who find great enjoyment in Ham Radio.

Interested?
MONTACHUSETT AMATEUR RADIO ASSOCIATION (MARA) would like to invite you to join them in the great world of Amateur Radio. Monthly meetings are held at the Knights of Columbus on Route 117 in Leominster on the second Wednesday of each month at 7:30PM. JOIN US!

This is being posted for a SYSOP at N3LA who does not have access to the Net.
===

Hi Roy,

Rather than chop out some headers entirely, I would favor recoding to make a typical header read as: (fake example)

```
R:910110/1839 21308@KB3PU.PA.USA.NA
vs
R:910110/1839 21308@KB3PU.PA.USA.NA [ZANY ARC - Norristown, PA] Z:12345 N:NODE
```

Allow the minimum needed by hierarchical forwarding and a bit of auditing and bag the rest (hard coded!) for a 50% saving.

I am told MBL software handles a message sent as "SP XXXXXX@W1AW.CT.USA.NA" with no problem, but chokes on one sent "SB XXXXXX@W1AW.CT.USA.NA" until the sysop creates a flood file for W1AW. PRMBS handles ANYTHING. I dunno what yours, RLI or CBBS do, but doesn't the concept of hierarchical forwarding dictate there should be no problem from either preceding example?

On this same general idea, why do some coders parse the H-address from left to right and others right to left? A message from CA to a bbs in Michelin provence, France (a fabricated example) gets to Maine and gets bounced back to Michigan cuz some software is more interested in the .MI. part than in getting it to France (.FRC.), or better yet just to ".EU" to begin with. Let those French stations worry where .MI. is after it gets to France!

My point? A little more "common sense" in the code and some better docs so the sysops will set up forwarding routes better and we could cut down on circuitous forwarding and increase reliability. With that we need less auditing and maybe can bag all R: headers except the one from the originating BBS. Til then we need something to help locate the systems with serious mail delay problems and maybe to trace a full return route for stuff that can't deal well with H_addressing.

Definitely DON'T keep "last 'N' headers plus original; if you must, keep first 'N' so as to have 'N-1' chances to get a return msg to a BBS which maybe "knows" the originator. The idea of needing a full return path in this era of H_addressing is bad, but when the original route begins in Maine, goes to Canada, down to Florida and arrives in Maryland ten hops later. . . Why should it return THAT way? Sheesh!

Let's also do something with explicit expiration dates on bulletins. Let the poster of a Kepplerian bulletin (as just one example) that will be stale in two weeks flag it to expire in 10 days to 2 weeks. If it is still plying the ALLBBS route at that time, it dies automatically. Why deliver stale mail @ALLBBS or @AMSAT or ANY flood route? Of course a message to a particular ham would not expire before delivery.

Thanks for the opportunity for input. I am grateful to all you hard-working programmers! Thanks!

73 de Jim, KB3PU @N3LA.PA.USA.NA

I have an 11 element 2-meter beam that I usually disconnect from my HT when not in use. I know a lot of the locals follow this practice, mainly for lightning protection. However, it has been brought to my attention that all of the RF energy from about 140 to 155 MHz that enters the antenna is being reflected at the unterminated cable end, back up the coax and out the beam. Is this legal? Do I need to connect a dummy load when the antanna is not in use?

I use 8-way Cinch-type connectors with all the 'vertical' pins for the + side and the horizontal pins for the - side. This way, there is plenty of metallic contact area (so i have no worries about putting 20 amps through them...) they do not melt, and reversibility is not a risk. Small nylon ty-wraps can be used to keep them mated in semi permanent setups.

```
     ! !   +ve
     ! !   +ve
     - -   -ve
     - -   -ve
```

These connectors seem reasonably robust (if you get the metal-shelled ones they survive being stamped on!). Some tape (or, better still, heatshrink tube) round the cord-grip clamp improves the life of the cables.
Remember to use the socket on the 'live' end, or you may be treated to an unexpected fireworks display when the live pins of the plug contact earthed metal.

Attention 12 and 10 meter phone operators licensed by the FCC. A number of US amateurs have been monitored operating SSB outside the subbands designated for phone in these bands, in violation of FCC rules. Remember that the lower limit of the phone band on 10 meters is 28.300 MHz, and the lower limit on 12 meters is 24.930 MHz.

I'd just build the RF switch, is it that hard?

Actually, I was shown a trick once, and used that in a 2M amp. Get 2 1/4 ELICTRICAL lengths of RG-174, and put two diodes, back to back, to ground at the junction. Then take the free ends and hook one to the amp output, one to the amp input. On receive, the diodes are high impedance and the cable appears as a bypass to the amp. On transmit, the diodes are driven to conduct, and the cable appears as a stub through 1/4 wave length, hence as a high impedance at both ends of the amp.

Not the best performer, but it worked until I could get the right relay.

Please recall that I asked for help in finding WB8ECC, since I am his qsl card letter manager, and he is not listed in recent callbooks.
A number of helpful folks out there in netland answered my request and gave me his current address, using the callsign servers. I had assumed that the servers had only what was published in the current callbook, but in fact they have much more than that. Thanks to those who run the callsign servers!

The address was sufficient to get his phone number from Information, so I called him. It turns out that he had let the WB8ECC license lapse, and then applied for renewal. Because he was outside the grace period, he could not get his previous callsign back, and was issued a new one, KF8ED. In an amazing coincidence, this is also an "8E" callsign for which I handle the qsl cards, and I also have cards on hand for his new call!

He was very glad to hear from me about the cards, and said that he had never understood about how the qsl bureaus work, or how to find out. Now he will be sending in envelopes, I'll send him all the bureau info, he will get all his cards from both calls, and the disorder of the universe will have been decreased.

A good example of the value of our widespread computer networks. The collective knowledge and resources of the people on the networks is a tremendous asset.

With respect to the possibility of Cinch-Jones connectors coming apart under stress, I would agree that the typical 300-series connectors will do that if they are heavily used (ie - inserted and removed many many times), and are subject to some force or vibration. But in most ham applications this is not really a problem.

In any case, it can be avoided by using the 200-series conectors. These have the same "innards", and are mechanically and electrically interchangeable and interconnectable with the 300-series connectors, but they have a threaded metal shell which will not come apart accidentally. I have used these in many applications. They are available in all configurations, both sexes for cable and chassis mount.

The 300-series is also available with an external locking clamp, which solves the same problem.

For larger currents, the 400-series is available, but they are not interconnectable with the 300-series. Our convention for very heavy loads is to use whatever size 400-series is required, and then connect the even-numbered pins in parallel, and similarly the odd-numbered pins, so that arbitrary currents may be carried.

The FCC database from ~10/89 shows it expiring in July of '97. In recent times even a change of address gives you a 10 year extension, so maybe you renewed and didn't know it!

I am definitely NOT in favor of any idea or proposal to restrict or eliminate the use of the CW/MorseCode emission/code mode on any amateur frequency.

Now that there is (to be) in place a way to get privileges on the amateur spectrum above 30 MHz, some are expecting, or fearing, a move to do the same thing in the spectrum below 30 MHz. I must acknowledge that I know that such a desire on the part of many does exist. However I know of NO ONE who has actually suggested that CW/MorsCode become a restricted or banned emission/code.

I also believe that now is NOT the time to proceed with any efforts to remove code tests from other license classes or to gain any HF privileges w/o passing a code test. Among the reasons are that there are still the international agreements/rules in place that affect this (referenced in the 90-55 FCC Report And Order); the HF band has some serious problems at the present time that could be aggravated but such a change; and we need to get the more experienced hams used to the idea of communicating with someone on the amateur spectrum who has not even tried to learn Morse Code.

To those who consider yourselves on the "winning" side in the 90-55 rule change, I urge you to put your efforts at the present time into helping to make the changes a success by working to attract new people into a hobby and service that has heretofore restricted its membership to those willing to try and able to learn Morse Code. These changes by themselves will NOT do anything for Amateur Radio; they simply give YOU the opportunity to do this.

If we cannot make this succeed, I doubt any other rules changes would have any hope at all.

      ^^^^^^^^
This is the approach Heathkit *should* be doing - simple kits which encourage
lots of experamentation. I was really disappointed when I got my first

Heathkit catalog in 15 years, and they didn't have hardly anything to build! They seemed to hold on to the 'Collins-in-a-kit' philosophy way too long. (With surface mount parts and wave soldering machines, et. al., home builder's just can't compete with commercial equipment these days...)

I was also encouraged by the fact that Ramsey is selling their stuff into the normal distribution channels (i.e., I can go down to my local 'Bandit' and pick one up for a few dollars.)

>

I noticed this too. A large part of their audience would be new novices and (coded) techs. Their kits are a good answer to 'how cheaply can I get on the air?'

> I have since ordered a couple of
> crystals from JAN ($8.95 a piece shipped). Like a ham friend of mine
> says...'upgrade and you can use the 7.04'.

I've had fairly good experience with Jan. I've ordered a bunch of crystals for my old Drake gear over the last few months (WARC + SWL bands) and only had problems with one of them. (Took them 3 times to get it right though.)

Does anyone know if any of the new dual band HTs available in the US have both 1750Hz tone burst and PL tone capability in the same HT which would ideally be front-panel programmable or easily jumperable without major surgery to convert back and forth. I understand in Europe this can be found rather easily so perhaps the radios DO do both but the one's sold

in USA have that not enabled???
I talked to Yaesu and they said these were solder-in modules, not
easily swappable (on their FT470).
Thanks...

The USUAL next step is to tweak the pll slightly. There is normally a test point where the pll (dc) voltage may be measured. Connect a dvm there and notice how the voltage changes as frequency is changed. Record the pll voltage at 162 MHz (or wherever the radio loses lock). Carefully tweak the pll adjustment (refer to the service manual for location) until the pll achieves lock at the higher frequency (in your case 165 MHz).
Of course, the downside of this is loss of low frequency range; i.e., as you shift the pll tuning range upward, you lose at the low end. You probably don't need the range 139 to 144 MHz anyway, do you?

I have also been bothered by RS salesmen insisting I give them my address. My dad figured out a way to call their bluff and I have since used the method myself many times. Just say,
1600 Pennsylvania Ave.
Washington, DC

and no junk mail will arrive at your home. That's what they want
the address for after all. I have had some of the guys behind the
counter recognize the joke and smile but have never had one refuse
the sale given the above address. And I don't even know the ZIP!

>I'm interested in experimenting with spread_sprectrum. Does anyone out have
>any info on the following:

>1. Can a narrow band FM tranceiver be modified to work spread ?

Sure. Take out the old guts and put in the new guts.

Seriously part of it probably can be used, such as the final stages and
the power supply. The narrowband parts could be as well but you'd have
to be inserting the spreading and despreading function in between so that
the narrowband IF strip, for instance, sees only the despread signal.

>2. Does anyone make equipment for Ham use either ready made or kit form ?

Buy any cheap cheap brand, toss into air over (emtpy) parking lot...
  --> instant kit

Seriously a good approach might well be to just take a radio apart, or
use transverter modules and do some building. You have to operate on
higher frequencies (I THINK 900 MHz and up) to do spread spectrum, and
are limited to 100 watts as well (NBD). But you might want to generate
the spreading function on a lower IF frequency (30 MHz and down) to make
that design aspect easier. If you aren't into building UHF RF circuits,

then buying transverters seems a reasonable way to go (much like using the DSY 56KB modem). I would not consider that a disqualification from being called a homebrewer either, as long as some significant part of the system was built (and even better, DESIGNED) by you, even if that part is totally in software.

Sorry for posting this here, but until a working E-mail address is found I don't have much of a choice. Hopefully this will be resolved soon. If not I have some tricks in my back pocket that I prefer to hold off using since they cause a lot of network traffic.

I tried sending some E-mail to Robert McGwier at the address shown in his posting and it was bounced back as "User unknown". The address used was:

    mac@idacrd.UUCP

There was no alternate address in his signature.

Here is the header of one of his postings:

> From: mac@idacrd.UUCP (Robert McGwier)

The FACT of the matter is that *neither* the Butternut nor the R-5 is anywhere
near a free-space half-wave (33 feet) on 20 meters, but the Butternut is
actually physically longer than the R5 by a good 5 feet.

As I already pointed out, making it an electrical half wave is a suboptimal mode
of operation if you can afford to have radials. If you can't, the R5 is better
than a Butternut w/o radials.

I don't care about RS having my name and address because I WANT to stay on the mailing list...I think too many folks in this group (and USENET/Internet in general) are overly paranoid about such things. I couldn't care less if they track what parts or other goodies I buy there. (Are you worried that someday the government might track down your unregistered radio???)

John, NK0R

(But I don't give my phone number at gas stations -- if they ask for "a phone" 303 499-7111 is a good one.)

Regarding Mike Owen's (W9IP) reply to Jeff NK3O's question:

It seems to me that the OLD Yeasu FT-726R answers a number of Mike's complaints about the '736. I leave the memories set in pairs for scanning the DX sections of a band. A simple push of the scan button then allows me to tune within the scanned range. By having scanning pairs on 6, 2, and 3/4, I can quickly switch between the bands in any order with the memory selection rotary switch.

I used the rig with an old TAPR packet modem for my meteor-burst 6-meter contacts years ago. The FM-FM modulation is certainly not the way to go for weak signal work - but it WAS quick and easy.

I find the '726 doesn't really need a preamp on 6, but does on 2, and REALLY DOES on 3/4. The '726 doesn't have a 220 module. It doesn't tune outside the ham bands. I have the 15-12-10 meter module - just 10 W - anyone want it? Having just 3 internal band-module locations, and no provision for an expansion chassis seems like poor planning in the 726.

Anyhow, a used Yaesu 726 might be a good choice for the money.

MY EMPLOYER WOULD HAVE A FIT IF IT NEW I WAS EVEN HINTING THAT A CERTAIN RIG MIGHT BE A GOOD CHOICE. Hi.

73, Bob W3OTC

PS: I tried various bit combinations on the band-indicator bus, and find that the display will indicate all the bands from 160m through 450 MHz, including 220. Either Yeasu was thinking big about more RF modules, or the display is common to a number of their rigs.
B.

I've seen them at:
Quement Electronics
1000 S. Bascom Ave.
San Jose, Cal.
(408) 998-5900

Prices ranged from $25 to $35 + optional case (extra $5 or so). Don't know who else carries them.

The responses so far show that they have had some value to those who have built them. Looks like each of the posters who have built one has then expanded
it in some way and so on. These simple kits appear to be a nice catalyst.
The spirit of homebrewing simple gear does seem to live on!

It's nice to be able to buy a 741 or 555 in almost any third-world county in the U.S. Otherwise, I boycott RS because of their obnoxious database scam.

I suggest that someone who has collected the present ongoing RS-bashing send it to the RS CEO, and tell him how widely this net is read.

Proofs should not be called "innocuous comments". You wanted to prove
a hypothesis -- and the material you provided in support, didn't. If you
can't handle that, I, too, am sorry. If you can't handle anything but ad-
hominum arguments, again, I am sorry. By all means, feel free to assault
the person when you can't support your position.

Thanks to all who responded to my recent request for help getting
started in ham radio. Just reading this group has been educational,
but I especially want to thank Dave Heller, Gary Coffman and John
Woods for their helpful and encouraging notes.

Now I've got a list of books to search for, some magazine titles, and
several good ideas about where to begin, all within a couple of days
of my original posting. Isn't the net great?! (I envision the world
of ham radio to be much the same...)

For those of you looking for the Ramsey address:

Their address is:

Ramsey Electonics
793 Canning Parkway
Victor,NY   14564
(716) 924-4555

73
__mike N5PWP@WA4EWV.TX

I am not employed by Ramsey nor do I have _any_ connection this is FYI.

John,
Tried to e-mail you but it bounced. Both Harris and Ten-Tec make
channelized HF commercial gear. You might try both of them, although
you might not like the price. Ten-Tec's number is in the adds in both
QST and CQ. If you can't run down a number for Harris, try ARRL HQ.
They used Harris gear in the recent W1AW upgrade and they may be able
to give you a pointer.
73's, Jim

>My brothers and I have been wondering about a way for us to communicate

The idea lacks only a way to convey your information rather than whatever
is already modulated on the signal picked up by the antenna.

Consider including a switch to gate the energy picked up by the first
antenna on and off on the way to the transmitting antenna. You could
employ something really exotic, like, maybe Morse code to convey a
message. The receiver then looks for presence or absense of energy
from your location. If the intended receiver can also receive the signal
you are using as an energy source then you could use a correlation receiver
to optimally extract the message.

Good luck with this. Is is legal? Hey, I'm no lawyer.

In article <1991Jan11.212206.16263@ux1.cso.uiuc.edu> phil@ux1.cso.uiuc.edu (Phil Howard KA9WGN) writes:
>
>I tried sending some E-mail to Robert McGwier at the address shown in his
>posting and it was bounced back as "User unknown". The address used was:
>
>   mac@idacrd.UUCP
>
>There was no alternate address in his signature.

You could always go backwards on the same path his posting took to get to you. In rn, you can view that path by typing "v" to restart the posting in the verbose mode. Here's the path one of Bob's postings took to get to apple:

```
     apple!sun-barr!cs.utexas.edu!wuarchive!udel!princeton!idacrd!mac
```

Thus, I can be sure of getting to idacrd if I address email via those same hosts in the reverse order. If you can find a shortcut to princeton, you can eliminate everything before it. (In Phil's case that should be a cinch, because both his host and princeton are on the Internet.)

There's also the "uupath" command from your UNIX shell, of course. When I tried it, I got "uunet.uu.net!idacrd". I don't know why that path didn't work for Phil; maybe uunet hiccupped.

In any event, I would think that a "usa" distribution would have been sufficient to solve the problem. I'm retaining worldwide distribution only because I hope that this followup information may be useful to others.

Subsequent followups should probably go to one of the mail discussion newsgroups.

Patty

Here is an item that might be of interest to the list.

--------------- Forwarded from steve@avalon.dartmouth.edu (Steve Campbell)-------------------

Lotus Development Corp. is bringing out a series of CD-ROMs in March that will include personal information on 120,000,000 individual Americsans, including an estimate of each person's income!

If you DON'T want to be in Lotus's "First Edition" I suggest you call this number pronto

800-225-5800

and ask Lotus to send you the necessary cards to remove names of each person in your family. They told me yesterday the cards will take 2 weeks to arrive and that I won't be on the CD-ROMs if I return them. How considerate of them.

For general commenting, you can write them at

Lotus Development Corp.
Attn.: Market Name Referral Service

As quoted from <755@ssc.UUCP> by tad@ssc.UUCP (Tad Cook):

+---------------
| This reminds me....I have heard that if some minor part on the motherboard
| of your average clone computer fails (say a DIODE, which costs about 9 cents)
| that NO ONE who you take your PC to for repair will ever replace the
| diode. They always charge you for a NEW MOTHERBOARD, since a failure on
| the motherboard is regarded as too complex, and they never attempt
| component level troubleshooting on these things anyway.
| Is this true?
+---------------

Usually, yes. But consider --- with the cost of labor on component-level repairs, is it cheaper to buy a new motherboard or to pay for 10 hours of labor to find one failed diode out of all the parts on the motherboard? This one makes sense. (It does *not* make sense that they won't replace the diode if you point it out to them... but if you can point it out to them, you can probably repair it yourself and save even more money.)

++Brandon

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

| I built the 2 meter receiver that is ne602 based.  It works but the
| squelch doesn't (though I made work after looking at the spec in the
| motorola book) and it really needs a preamp.  Though for ~$20 what
+---------------
```

You mean maybe I *didn't* somehow blow up the squelch when I assembled the 220 receiver? Have to get my hands onthat spec sheet and see if I can make it work --- another 220 receiver would be nice.

(No, that's not a sarcastic remark. I checked the bloody thing twice and had
someone else check it as well: everything wired correctly, the right parts in
the right places, no cold solder joints --- and the squelch didn't work. I
sidelined the thing because a battery-operated 220 receiver without a working
squelch makes for large battery bills....)

| like to see improvement in the BBS software on packet. It is o.k.
| for message passing, but discussion groups just don't seem to work
| out. Maybe the solution is a TCP/IP based net running something like
| news. It seems like a good application for nntp.
+---------------

We're going to be trying this locally soon, using the G1EMM and PA0GRI versions of NOS which support NNTP.

However, TCP/IP is less than optimal (read: sluggish to miserable) over slow links. I'd like to see some redesign done in that area; I'm considering an encapsulation of IP in PPP at the moment, but I'll have to look over the protocols and see what, if anything, might be gained. (Not to mention getting someone else locally to get a UNIX system to run my software on so I can test it....)

   I am "Big Steve" of Radio Newyork International and I'm adding a
new portion to my program called CROSSBAND.  This program will feature
reports on Ham and Shortwave, including broadcasts, pirates and utes.
I HEED YOUR HELP!  If you would like to provide information for the
program please e-mail or snail me at the address below.
   You will be given on air credit, I don't get paid either.

   I will be gathering information from the newsgroups and other networks
and I will be airing the Westlink "Newsline" program and providing credit
to the authors.

Tube reuse in this fashion was somewhat popular in the thirties and forties. With the proper circuitry, a tube can be used to simultaneously amplify AF and RF signals. Pentagrid tubes have been used as oscillators and mixers at the same time that they acted as the AF amp. It's fasinating to look at some of the older equipment to see how stage economy was achieved.

Unfortunately, one of the ways that RS salespeople are evaluated is
by percentage of names and addresses obtained. If you refuse to give
your address, the guy might get mad because it will be a "black mark"
on his numbers.

However, let me reiterate that the official Tandy policy is that your
address is NOT required for ANY transaction. (except maybe for
repairs)

Tandy's good ol' boys in Ft. Worth feel that the mailout flyer helps
keep Radio Shack in business. I wonder if they know how much they
offend people when their employees are rude about getting the name
and address. Radio Shack is the only store I know of that does this.
If the flyers were so important, then everyone would be doing the same
thing. I wish RS would do a study on this aspect of their business.

```

You are right.

When I said "fast CW snobs" I did *not* mean that fast CW operators
are snobs. Apologies to anyone who took it that way.

I mean that there are some hams (predominantly _not_ actually using CW)
who are immensely proud of having passed a 20 wpm exam, because
they know virtually nothing about radio except Morse code!

And _these_ are the people who will brag about how they "earned" their
license by working hard to learn the code, and everybody else must "earn"
it that same way, for ever and ever, amen.

In short, I'm talking about people who seriously misunderstand the
purpose and nature of Amateur Radio. And there are a fair many out there
(particularly on Fidonet, which attracts a less academically oriented
clientele than Usenet).   'Nuff said. That was my original point.

> kit to turn AM radio into shortwave receiver

Presumably your problem is that AM stations are 10 kHz apart, but
shortwave broadcasters are 5 kHz apart, so you miss half of them
with a digital radio.

You could use 2 crystals and switch back and forth between them
(e.g., 9.000 and 9.005 MHz). Custom-made crystals cost less than $10
each from a company such as JAN.

I thought about this when designing the "High-Performance Shortwave
Converter" that was in Popular Electronics -- essentially the same
widget. (Your LO _is_ crystal controlled, isn't it? Does the PC board
say SPC on the bottom? If so, you may be using my invention!)

This is NOT another question about the procedure for obtaining a code-free Technician license. Rather, it is regarding expiration of CSCEs. I received my tech ticket back in June and passed the General theory as well, so I have a CSCE for Element 3B.

Now, suppose I go to a VE session next month and try for my Advanced ticket and pass Element 4A (theory) but fail 1B (13 WPM). Obviously, I remain a Technician class licensee and receive a certificate for 4A. What happens if I do not pass either the 13 wpm nor the 20 wpm code tests before June? Does my credit for 3B vanish, meaning I'll have to retake that element as well as 1B to get an Advanced license or is my credit for 3B extended until the expiration date on my CSCE for Element 4A? Or something else entirely? I am asking because it is a very real possibility that I'll pass 4A and fail 1B, as I find it difficult to force myself to study the code regularly during the semester, whereas memorizing the band plan is going to be the toughest part of 4A (I'm an EE student in the control & communications systems area - and yes, I've seen the previous question pool - no problem.)

Thanks and best wishes.   (Or should that be TNX ES 73 ;-)

In Australia, Tandy (the local name for Radio Shack) also indulges in this rude mailing-list behaviour. Or they did last time I bought something from them, which was some time ago :-)

Tandy-bashing is one of my favourite pastimes. I fondly remember the day several years ago a friend and I went into a Tandy store and paused briefly to look at the Trs-80 Model 1 on display. Suddenly the picture disappeared and the power LED on the computer faded. It took a few moments for us to realise that a salesman had actually _sneaked_ from behind the counter around the desk where the computer was sitting, and _pulled the plug_ on a couple of unsuspecting potential customers! I guess that takes the "arrogance" prize.

Another cute trick is to walk straight into a store holding one of their "battery a month club" cards, and ask right out for a battery. Often they'll prevaricate by saying "out of stock, they'll arrive next Friday". Then have a friend go into the store and ask the salesman some 'dumb customer' question before asking for the battery. The response will be very different!

Onto the question of skill, I found in general that Dick Smith (the 'other' popular electronics store in Oz) employed electronic enthusiasts, who may not be experts in the field but at least knew the difference between cathode and anode. Tandy on the other hand tended to employ marketing types whose knowledge of electronics was doubtful at best. One can always say that Tandy's thrust has always been towards "consumer electronics" such as stereos rather than components, but I think that K-mart salesmen could have done as badly. The TRS-80 was a very popular beast in its day. Surprisingly so when I recall that in the early days (e.g. '78 - '83), Tandy salesmen knew _nothing_ about the computer systems they sold.

Anyway onto their policy of requiring name & address ... I have never
been refused a cash sale, in fact it never occurred to me that anybody
could be so foolish as to refuse. But I have had my share of fun -
I once told a dolt, poker-faced, that my name was Jehovah. The dolt then
asked for my address, so I wrote it directly on the pad: "No Fixed
Address - Late Of Heaven". Of course he didn't catch on, but I had
difficulty leaving the store before exploding.

So if you get tired of people with their head up their ass, poke some fun!
Nick.

In the early 70s I worked at Amateur Radio Supply in Seattle. About
once a month someone came into the store to return one of those
W2AU type baluns that are used for the center of a dipole, complaining

that an ohmeter test of the feedpoint showed that it was "shorted."

(hint: the DC resistance across the winding will always be very low. At HF it is something else)

Get on the mailbox freq, and send the selcal for the mailbox. Then it will prompt you to login (don't use +? command, because it does all this for you).

Then type:

LOGIN WA6SDM

Again, don't put +? at the end of this. It will change the link direction for you when it sees a command followed by a carriage

```
return.

It's true that Novice tests aren't per-se part of the
VE program - but I'd imagine most sessions
will welcome a prospective novice.

We always have let anyone walk in, take whatever
elements he wants, and when/if he passes,
encourage taking more.

Nothing to do with R//Shack, but:
a year or so ago I was in a branch office of a rather
major concern and saw a sign on the counter:
"We cannot accept $100 bills"
This outfit went by the name U.S.Post 0ffice,
Conshohocken PA and preferred to be known as 19428.
Couldn't get a decent answer from clerk,
and wasn't quite sure I wanted to know why.
But fortunately I was able to complete my purchase
with 50s and 20s so everyone was happy.

I'm sure this posting has generated considerable debate.

In article <819@wells.UUCP> k3tx@wells.UUCP (Dave Heller) writes:
>In article <2992@ux.acs.umn.edu>, spexet@ux.acs.umn.edu (D. Robert Spexet II) writes:
>Of the "Asian riceboxes" (I have other names for them, but some seem
>to take offense)

They take offense because it's a racist remark.

>What's the big problem with used equipment? If it's Drake or Ten-Tek
>you can't go wrong - anything needed to bring to new condition is
>simple. Or do you have your heart set on an import?

The problem is that used Drakes can cost as much as new Icoms. That's
what the problem is. Another problem is you don't know what the
previous owner did to a used rig, and there's no warranty.

>Probably the best possible beginner's setup is either a TR4 or Triton-
>540-544 (all the same thing) plus a decent tuner (NOT MFJ!) + home-brew
>wire antenna + keyer, preferably home brew for about $20 max with a
>Curtis chip. Plusses:

I agree that the TR-4 is a great rig. It can be had for $250-$300 used.

I hear so much MFJ-bashing on the air. I have two MFJ tuners and they both work great. The workmanship on them is good. Perhaps their quality has improved lately.

>> About the 725-6-35: performance at the upper end of the *oriental* range
>Ease of use: Poor
>Serviceability: Better than zero, but not much.

I have no trouble using my 735. Unfortunately, if you want to pack that much into a such a small box, you are going to sacrifice serviceability.

Unfortunately, I haven't done the mods myself. I bought the unit used from a fellow ham.

Anyway, the RX coverage is controlled by the initialization diode matrix - and the schematics show some configurations.

I asked the guy who performed the act with them tiny chip diodes.. he said that he had some modification instructions - but they did not work. He ended up trying a few combinations.. and found one that worked.

This leads me thinking that maybe he didn't found the perfect one yet.

The TX supposedly needs some other work as well.

I shall be left waiting for your version..

You're talking about the "CMOS Superkeyer II", no? I recently was looking through the Nov '89 issue of QST, which had a construction article for the "CMOS Superkeyer". One of its deficiencies noted in the article was how it, when powered-on, would sometimes come up generating dits [I believe], due to the fact that the logic would come up in a random state upon power-up.

I thought to myself and ask you guys: "Haven't you ever heard of a power-on reset? A power-on reset has been a standard feature [um, one part of a chip, one capacitor and one resistor, if I remember correctly - cheap] in homebrew computer circuits since the mid 1970s.

ZCZC AE08
QST DE W1AW
DX BULLETIN 2 ARLD002
FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 11, 1991
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

Thanks to Paul Young, K1XM, and the Southern New England DX Asociation and Paul, KB1BE, and the Connecticut DX Association, and IARU Liaison Officer, E. A. David, ON5IA, for the following DX information.

FROM THE DXCC DESK. Documentation for 7O8AA has been received and accepted. The 7O8AA, as well as the 7O1AA cards for the new Yemen Republic, will be accepted on or after March 1, 1991. On this date, 4W and the old 7O, North and South Yemen countries, will become deleted on the DXCC Country List.

BELGIUM, ON now OT. For the 60th anniversary of the King of Belgium, the Belgian RTT has agreed to use the OT calls, replacing the ON calls, until July 21, 1991.

CAYMAN ISLAND, ZF2. Bruce Frahm, K0BJ, will be active as ZF2NJ from January 19 to February 2. Mostly active on 10 thru 20 meter CW. Some SSB is planned. QSL to PO Box DX, Colby KS, 67701, USA.

SAN FELIX, XQ0. John, XQ0X, has been active on his own, and with Mickey, CE3ESS as a helper. Often found on 14236 KHz around 0200 UTC operating either split or on his own. Listen around 14230 to 14240 KHz on his frequency with a list operation. Also try 28493 KHz around 1400 to 1800 UTC. QSL to CE3ESS, after January 15th.

MARION ISLAND, ZS8M. ZS8MI, Gerard, has been active on 21246 KHz at 1630 UTC. Also, 14260 KHz at 1300 UTC and 7047 KHz at 1900 UTC for Europe. Look around 14025 KHz from 0100 to 0300 UTC too.

CANTON ISLAND, T31. Kiyoko, will sign T31KY for the next 2 to 4 weeks. She is found on 10 to 20 meter SSB.

ETHOPIA, ET. An Italian operation from Ethopia is expected on or about January 15. Be on the lookout.

AFGHANISTAN, YA. YA0RR, Romeo, has been on 40 meter CW at 7005 KHz around 0030 UTC, listening up. Valery, YL1WW is also active from YA0RR on 80 thru 10 meters. They are working the eastern USA from 2300 to 0300 UTC on 7003 KHz. Also working the USA on 28495 at 1300 UTC and 14019 KHz at 0400 UTC.

PITCAIRN, ISLAND, VR6. VR6BX has been reported on 28453 KHz around 2130 UTC.

MALAGASY REPUBLIC, 5R8. 5R8JD has been on 28510 at 1700 UTC several days this past week.

MALAWI, 7Q7. 7Q7LA AND 7Q7EC are found around 28510 to 28515 at 1700 to 1900 UTC. 7Q7EC is also on 40 meter CW. QSL manager for 7Q7LA is G0IAS.

OMAM, A41. A41JZ is active on Wednesday UTC from 0200 to 0300 on 3502 and 7002 KHz.

ALBANIA. HA0NNN reports that the HA group will try to pursue this one after things settle down in the Middle East. They are also investigating operations from ET and 9U.

WARC BANDS. A61AD is active most days from 1100 to 1400. QSL via WB2DND. Also reported on the WARC bands are AP2JZB, 7X2VRK and A22AA.

GOOD LUCK ON DX DE KB8NW/OBS

Yeah, I bought the 2 meter HT amplifier for $20.00.  I thought that it
would be such a deal ... 2 watts in and 25 watts out.  Ah, but there's
a catch.  You also needed the RF-Operated T/R switch, which of course
the "Q" was out of stock on.  I didn't find out about that until after I
bought it an opened the package.  I also wonder what I'm going to do for a
heat sink ...

I thought that the FM stereo transmitter was pretty intriguing, but I
wonder what else I need for that kit.

That was Phil's point. The FCC doesn't care if there is cheating because they
don't attach ANY importance to ANY code testing.

This code testing is of trivial importance. The issue I, as a taxpaying U.S.
citizen, am REALLY pisssed about is that West Point no longer requires cadets
to take classes in horsemanship. How in the hell do they expect Army officers
to worth anything if they can't ride a horse?

Gil gave us Keplerian elements for the ascent profile he is working on for STS-37. Thought netters might want to start planning for the STS-37 flight with the all amateur radio crew coming up in April.

CDR - Steve Nagel, N5RAW
PLT - Ken Cameron, KB5AWP
MS1 - Linda Godwin, N5RAX
MS2 - Jerry Ross, (awaiting call)
MS3 - Jay Apt, N5QWL

Plans are to operate the packet robot, voice, and slow scan TV, all on 2 meters. Probably slow scan, voice and packet during crew wake hours and packet during crew sleep time, for 24-hour SAREX ops (we hope). This is a 5 day flight. Primary payload is SAREX, with the Gamma Ray Observatory to be deployed between QSO's if time permits. (ha, just kidding, GRO is primary, of course :-)
--GaryM

From: WA5NOM (Gil)

Here are elements which match the latest design profile, rotated to the current launch date of April 8. I posted them on Chuck's JSC Public Information BBS a few weeks ago. The passes for JSC are in the morning; 0900-1800z.

All of this "name and phone" business sounds like
everyone wants to give everyone else a hard time.

If they didn't ask for the info you'd probably be
begging them to take it and keep you on their mailing
list.

I like being on the mail list for things that interest me,
and thank R.S. for being so considerate.

And, ;just like any other businesses, you find good and
bad behind the counter. Frankly, it would seem to me
that RS is a bit above average in ;this regard.

But, since it's in fashion to say bad things about RS,
I have to agree that their prices for, say, a half watt
resistor are mucho on the high side. Of course I have
a 2000 sq ft junkbox with nearly everything in stock
mostly slightly used, so never ever <<buy>> resistors
or anything else for that matter. Buy? dirty word.

I thoroughly agree.   The ARRL publications all told are
the best, especially the Handbook, the Antenna Book and anything
by Doug DeMaw.   The new pub on transmission lines by W2DU
will likely become a definitive text, and not just for the
Amateurs.

However, for the bare question pools and a bare copy of Part 97,.
see W5YI.

This is a periodical (monthly) posting to announce the availability of CAPITAL, a Civil Air Patrol electronic newsletter published on a more or less weekly basis.

The Civil Air Patrol is an auxiliary of the United States Air Force, that provides emergency services (including search and rescue missions for downed aircraft), aerospace education, and a cadet program. As part of its operations, the Civil Air Patrol operates a radio communications network.

If you are interested in receiving this newsletter, please send your name and InterNet address to aviator@athena.mit.edu. If you are a current CAP member, please include grade, squadron, charter number, and callsign. Submissions will also be accepted at this address.

The most recent issue of CAPITAL is Volume 2, Number 1.

If you have asked to receive CAPITAL previously, but are not receiving it, chances are there is a problem with your path. Please send another request, indicating that it is your second request.

Back issues are available via anonymous ftp (login "anonymous") at rascal.ics.utexas.edu [128.83.183.20] in the following form:

/explore-me/av/capital-folder/capital.NN

where NN is the issue number.

Please feel free to distribute this article further.

```

>really cheap to build. It just uses a couple of op-amps and an A/D converter.

I have created a wefax decoder for the amiga computer, and my radio interface is even simpler than that. I use exactly one LM339 comparator chip and some resistors, a diode, and a few caps to provide the signal to my amiga. It seems to work just great. I might be able to get better data if I were to throw in a bandpass filter, but I doubt it. The CPU does all of the FM decoding, color selection, and display on the standard monitor. It hooks up via the parallel port on every amiga available today.

>I noticed someone commented about using a DSP system for this. That would
>ideal since you could program "software" filters and maybe even do enhancement
>right there in the DSP chip. Unfortunately, my math background is not nearly
>adequate to DSP (after I complete undergrad work, i'm going to do something
>about that) so mine won't have that. I'd like to see a DSP-based WEFAX decoder
>if someone does do one.

I am at the stage of adding image filtering to my program. I find that with my radio/antenna system, most of the problems come about due to bursty noise that is picked up and sent thru the radio to the computer. I plan to add software to do a variety of filtering by using a 3x3 graphics kernal. This method is a way for the program to do averaging, weighted averages, edge enhancement, or transition enhancement. All you do to change the filter type is to change the weights of the graphics kernal. If you are interested in the technique, let me know via e-mail and I'll let you know how I plan to do it. The idea is really a very basic and common thing in the image enhancement world. The trick is to figure out how to do all the math in real time, as this type of filtering (or any other filtering I'm aware of) is full of all kinds of multiplications and additions. I plan on using lookup tables to handle things quickly, especially the mulitplies and dividing required to create the new pixel from received data. I haven't yet actually added the filtering yet, so we will see if my ideas are really implementable. I suspect that they are. Of course, the amiga really isn't too usable while an image is being received.

>I think a WEFAX decoder is a great homebrew project. The project is complex
>enough to be challenging and yet can be done with fairly modest components and
>equipment. Taggart's book is required reading for this project.

Well, I haven't read his book because I can't seem to find it locally and he doesn't answer my mail. I got all my info from asking questions on the net. I would really like to get a copy of it, so if anyone knows of a mailorder house that carries the latest version, please let me know. I agree that a wefax decoder is really suited to homebrewing. Once the information is

gathered, it is a challenge (but quite doable) to design the hardware and
figure out how the software will work to display the image. Not everyone
can do it, but it is DEFINATELY not impossible for those that want to.

Re: my opinion that a digital Hilbert transform is a pain in the
behind,

mac@idacrd.UUCP (Robert McGwier) writes:

>On the other hand, IMHO, Hilbert transforms are absolutely trivial in DSP.
>Here is a simple approximation to a Hilbert transform:
>
>take three consecutive samples x0,x1,x2
>
>x2-x0 is the filter

This is like saying an analog second order high-pass filter using
a 741 op-amp is a 90 degree phase shifter. It is - for a very
narrow band of frequencies.

So, before we mislead the folks not yet familiar with DSP that DSP
can perform miracles like the above :-), shouldn't we point out that,
for the generation of SSB, the equation you gave is just as useful
as the second order analog filter built with inexpensive Radio

Shack parts?

Just like the 2nd order analog filter, it will not maintain an accurate enough quadrature over the 10:1 frequency range (say, 300 Hz - 3 kHz) that you would need to give good opposite-sideband suppression. Hand-wavingly, you have to be within a tenth of a radian to get the 30 or 40 dB sideband suppression.

And, on top of not having a flat phase-shift, the frequency response of the thing you described is horrendous. The analog example I gave was no accident. It has a frequency response much like your 3-tap (center tap has coefficient 0) FIR :-).

>This will do a hilbert transform quite well in mid band.

In fact, *precisely* as well as the el-cheapo analog filter. :-) :-)

>To have
>one that works over an extended band, one breaks out the old Park's
>McClellan algorithm, punches up Hilbert transform, picks the bands
>you want to transform and tell it to go.

Actually, in the case of Hilbert transforms, life is much simpler by resorting to first principles instead of using Don Lancast... oops, I mean the Parks-McClelland cookbook methods.

Simply design a cheap and dirty "halfband" low-pass FIR filter. Negate the sign of *every other* odd coefficient. The even coefficients of a halfband filter are already identically zero (convenient, isn't it?).

Done.

You now have a low-pass approximation to the Hilbert Transform. Pretty standard trick.

But... I still consider this a royal pain, especially if a way can be found that does not require a Hilbert transform at all.

Afterall, a "phase-sequence filter" made up of 5% resistors and 5% capacitors, like the one found in the 1990 ARRL Handbook (also Horowitz and Hill, 2nd ed.) would give as good phase characteristics as a 49-tap FIR. Much cheaper than a 56000, too :-).

Don't get me wrong. A decade or two ago, I used to practice DSP for research and for a living and I think it is a wonderful way to do signal processing. And everyone should have the chance to at least get a taste of it. Here, I am in FULL agreement with Bob. It is difficult, for example, to tweak an analog balanced modulator for good sideband suppression; but it is trivial to do that in the digital domain - short of bugs and truncation errors, you can almost not avoid perfection.

However, IMHO, there still are solutions that are both more elegant and simpler using analog techniques. And, it doesn't hurt to look for ever *simpler* solutions in the digital domain even if a one already exists. That is why I mentioned the Weaver method as a substitute for the more well-known methods of SSB generation (i.e., the filter method and the phasing method).

> [For the curious, the Weaver method was described by a W1PNB in the September,1957 issue of QST.]

BTW, Bob, do the even coefficients of the Hilbert transform that popped out of the Parks package come out as zero? If not, the halfband approximation above will allow your Hilbert transforms to use only half as many active taps. I.e., half as many multiplications per data sample.

                    SPECIAL SOLAR TERRESTRIAL BULLETIN

                         Artificial Aurora Alert
                             10 January, 1991

                        /\/\/\/\/\/\/\/\/\/\/\/\/\
```

The Barium chemical release and thus the accompanying aurora which was planned for 01:43 UT had to be SCRUBBED due to bad weather on the east coast of the U.S. and carribean sites, which caused a lack of reliable observing sites.

My apologies for relaying some inaccurate data in the last bulletin. Unlike the last bulletin, the current data in this bulletin (and future bulletins) is obtained directly from the Marshall Space Flight Center and hence should be accurate.

To correct erroneous data presented in the last bulletin, please note the following. Aurora's will be visible between 10 degrees to 50 degrees above the SOUTHERN horizon (depending on your location in the U.S. or Canada). There will be four releases of Barium and three releases of Lithium take place throughout the month.

There are currently TWO releases planned for 13 January, weather permitting. A large Lithium release is scheduled for 07:05 UT on 13 January. A small Barium release is also scheduled for 02:18 UT *OR* 02:58 UT on 13 January. These releases will depend on whether the number of requisite viewing sites with good weather can be achieved.

For direct information regarding the status of these releases, a hotline has been established. The number is: (205) 544-5356.

Hello !!

I'm interested in experimenting with spread_sprectrum. Does anyone out have any info on the following:

1. Can a narrow band FM tranceiver be modified to work spread ?
2. Does anyone make equipment for Ham use either ready made or kit form ?

I would appreciate replies posted so others that may have an interest.

```
Thanks,
Thad      KG5ES

I don't really mind giving the information out once in awhile, but sometimes I'm in a hurry, I just want them to take my money, give me change and a receipt and let me go. [I've already paid to much for the part, but Salt Lake City isn't Silicon Valley -- I make a pilgrimage to Fry's whenever I get to Santa Clara] --- On one occasion I said "My time is more important to me, than your mailing list." (Politely, but I was in a rush) --- The response was "you can shop somewhere else" (half under breath) and a receipt.

In the same store, on another occasion in the same store a middle aged woman took the cleark to task over address info for a charge.

I know in the old days the stores used to get something like 2.5 cents a name and address, so when I worked part-time at one store, I was supposed to go through the phone book during slow periods and fill in names on reciepts where people did not give the information (during slow periods).

Maybe someone should capture this whole thread and mail it to the CEO
of Radio Shack?

John KD7UW

>component level troubleshooting on these things anyway.
>
>Is this true?
>

Quite often YES; it is cheaper to replace a whole motherboard (or disk
controller or whatever) then to have a repeat callout for the service
team. Remember in many instances the travel time costs more than the
parts used. Often, disturbing an old board increases the probability of
subsequent failure (disturbing old dry joints is not a good idea).
It is also easier for the repairer to offer a 90-day warranty if they have
fitted a whole assembly straight out of the box.
And then us hams get their hands on the 'dead' boards and replace the diode.......

Don't laugh, Jim. The Texas Rangers (yes, they still exist, as a unit of the
Texas Department of Public Safety) still require their members to own a horse,
and they're well respected as an elite law enforcement unit - with stringent
entry requirements, and a long, long waiting list to get in.

Next silly example?

I know that the VE organization doesn't presently (before no-code) give Novice exams. But I would assume that if a non-ham goes into a walk-in exam site for his Technician, that he would be given the Novice and Tech written as well as the 5 wpm code. Is this correct? A friend of mine wants to get his Tech license before no-code starts, and there is a local walk-in exam on the first Saturday in February.

Does anyone know of any VE tests in or near Nags Head, NC? My uncle is studying now for his advanced ticket, and hopefully soon we'll need to find a VE! He actually lives in Spot, but anywhere within 75 miles of Nags Head would be fine. Thank you in advance,

If it's a news release, W1AW bulletin or something of that sort, you can use it. If it's something from QST or another copyrighted ARRL publication, you need permission (routinely given, but ask). Basically, if there is a copyright notice anywhere on the page, you need permission, otherwise not.

If you want to reprint copyrighted ARRL material, seek permission by writing to:

I don't shop much at RS because of the problems discussed here. But RS is not the only store that is in the dark ages when it comes to dealing with customers. I was in Sears the other day trying to purchase a pair of pants. When I tried to use my MAJOR credit card I was told they only take Sears credit card, check or cash. I had no cash, my sears credit card was at home, so I wrote a check. For ID the cashier asked for my drivers license and a MAJOR credit card. She then proceeded to write down my credit card number on the check, with my drivers license number. I didnt think about it till later, but they could use my credit card number to commit fraud, even though my check is good. Now I remember why I never shop at Sears, they are still in the dark ages of modern finance. Go to the local grocery store or Walmart and they run your card (just about any card) through a slot, the register prints your receipt, and you are on your way.

You know, I've been in RS stores all over the northeast U.S. and have _never_ had a problem with refusing to give my name and address. Maybe it has something to do with the way you refuse? In any case, my experience hasn't changed due to the advent of the point-of-sale terminals. They can skip over the phone-number stuff and go directly to entering the purchase info. (I don't know the details, but I've seen it done numerous times.) And no RS employee ever seemed confused about how to do it, either.

I dunno, maybe it's a regional thing.

I also have had the same exact problems that Marc mentioned in his note yesterday <mlefebvr@ireq.hydro.qc.ca>.

I am using a Sharp laptop which locks up, also cannot get Com 1 or Com 3 to be regognised, as only Com 1 is available I'm anxios to find a solution. The people who have got it run sound enthusiastic about it.

SpaceNews

MONDAY JANUARY 14, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States. It is published every week and is made available for unlimited distribution.

* SALYUT-7 NEWS *

The abandoned Soviet space station Salyut-7 is losing altitude rapidly and is expected to re-enter the Earth's atmosphere shortly. Salyut-7 was launched on 19-Apr-82 from the USSR, and its orbit has dropped 125 kilometers in altitude in the past year. The following chart illustrates the rapid decay of Salyut-7:

Date	Epoch	Mean Motion	Decay Rate	Mean Altitude (km)
04Oct90	90 275	15.74591875	0.00048781	345.861317
11Oct90	90 283	15.75692165	0.00075804	342.730818
18Oct90	90 290	15.77179921	0.00118039	338.503706
24Oct90	90 296	15.78544938	0.00100890	334.631165
01Nov90	90 304	15.79911872	0.00087634	330.758778

20Dec90	90 352	15.91896486	0.00174533	297.045069
27Dec90	90 361	15.95063508	0.00196572	288.206543

Salyut-7 carries an object number of 13138 and has been heard transmitting telemetry on a frequency of 19.954 MHz. COSMOS 1686 (object 16095) is also in a similar orbit and is expected to decay with Salyut-7.

A good approximation for predicting the re-entrance date for Salyut-7 is given by the formula:

Epoch + (16.666666 - Mean Motion) / (Decay Rate * 10)

This places the re-entrance date around 01Feb91.

* CRRES NEWS *

NASA will use the Combined Release and Radiation Effects Satellite (CRRES) this month to study the Earth's ionosphere and magnetosphere. CRRES will release chemicals in space that will produce clouds of artifically injected charged particles, which when illuminated by the sun, will produce brightly colored patches in the night sky. The patches should be about the size of the full moon and be nearly as bright.

The releases should be visible from the entire continental US, most of Canada, Central America, the Caribbean, and much of South America. The clouds may also be visible low in the western skies from western Africa and Europe several hours before dawn.

A total of seven releases are planned, three in which lithium will produce a red glow and four of barium, which will glow green and purple. The release opportunities will occur on the nights of January 10, 12, 14, 15, 17, 19, 21, 23, 24, and 25. Exact times are tentative, but should occur around 8:45 PM EST.

Here is a set of Keplerian data for tracking the CRRES spacecraft:

```

Here are the details of a mod I sent to MT a few years ago:

This will change the function of the MS key on the remote control to select SELECTED MEMORY SCAN instead of MODE scan. Why they didn't provide this as a function in the first place seems rather odd.

On the remote control option board inside the R7000, remove the cathode of D40 from the board and bend the diode up slightly. Attach a small wire, like #30 wire-wrap or something, to the lifted cathode and tack solder it to the cathode of D32.

You could do this with cuts on the board but the tack solder method allows the mod to be backed out easily if needed.

An alternative method is to run the wire from D40 through the hole where it used to be, and solder to the gray wire (pin 8) of P1.

I figured this out with a scope and the schematic. The switches are all polled by the CPU through a diode matrix. Lots of combinations are possible but I didn't fool around too much.

Although I haven't finished the Ramsey 40M QRP rig I have read through the instruction book and I would say that Ramsey appears to be trying to emulate the Heathkit approach to kit building. The manual I have has a few hand-written notes in it but that kinda makes me feel better. Someone has taken the time to go over it and check it for accurracy. A review was done of this particular kit in the Dec 89 73. The reviewer mentioned that the instuctions seemed to be written for people with experience in electronics (no resistor color code breakdowns). It appears Ramsey took that to heart, there are now color codes in the instructions.

My only complaint was with the crystal frequency supplied in the kit. It was for 7.040 (the QRP international calling frequency). The problem is I am a Tech and Techs can't work that freq. I called Ramsey and it was explained that to hold down the cost of the kit they ask around to the crystal manufacturers and they buy up quantities of whatever is available. The author of the 73 article complained about the fequency of the crystal in his kit also. The crystal was 7.1mHz (the Novice fequency)! I have since ordered a couple of crystals from JAN ($8.95 a piece shipped). Like a ham friend of mine says...'upgrade and you can use the 7.04'.

I'll let you know how it works out after I get the kit built...and the new crystals.

Michael. A Covington writes:
-> The main motive for homebrewing a 2-meter rig would be self-training,
-> not saving money. It would have to be inexpensive, however, because
-> people wouldn't want to spend $250 on a self-training project when
-> they could have a full synthesized HT for that price.

But that's not the point. What I'm interested in is DESIGNING and
BUILDING the equipment. That's my hobby. Actually using it is very

secondary. Many of the things I built cost much more in parts than I
could have bought a complete unit for. But I wasn't homebrewing to save
money. I was homebrewing because that is what I was interested in.
 On the other hand, a bit of imagination can save a lot of money. The
only cost of my first 2-meter station (receiver and transmitter) was
solder. Everything else was recycled - now there's a very trendy word
:-{) , from discarded TV sets. These are still a wonderful source of
parts for homebrewers.

>This is a great idea. Actually, getting into homebrewing is easier today than

This is a bad idea. What the amateur community does *not* need is yet another
class of license. Actually building something from scratch that works should
be a requirement for The Amateur License (singular). It would be a bear to
implement though.

>ever before. There are many good references available today (Demaw,Hayward and

What you say is true on the lower portions of HF where FM is not legal. But at 10 meters and above, where low power rigs really shine, FM is legal. You can build competitive FM transmitters as easily as CW transmitters. And more importantly, you can build FM receivers that can compete with the commercial rigs without being an electronic engineer. A first class CW/SSB receiver is a major project. There probably aren't two dozen homebrew CW/SSB receivers in the country that can compare favorably with commercial equipment. There are thousands of homebuilt FM receivers that are every bit as good as their costly commercial competition floating around.

>Now for another even heavier note of irony. If the current attempt to drive CW

>are not aware of the large volume of CW activity that is going on and the useful
>place CW occupies in the Amateur Radio Service. If they win, we all lose. But
>thats politics.

I don't think that what you are saying is true. Most people who wish to reduce the role of Morse *testing* in our licensing structure do so because they believe it's unfair to give so much emphasis to one operating mode on the exam while virtually ignoring other more popular modes on the test. This is a *testing* issue not an *operating* issue. Anyone wishing to operate CW will be forced to gain competence in order to do so effectively. Testing is irrelevant.

Some also feel that reserving nearly half of the HF amateur spectrum exclusively for narrow band digital modes at the expense of wide band modes is unfair. CW transmissions are legal on every amateur frequency while SSTV and voice are restricted from using nearly half of the HF spectrum. Narrow band digital modes other than CW are restricted to less than half the HF spectrum and wide band packet is prohibited completely. So CW operators have the run of the entire spectrum while other users are restricted to cramped ghettos. Does that seem fair? I don't think that CW is likely to disappear from the HF spectrum, but I do think that CW operators are likely to have to share the spectrum more fairly in years to come. After all they are the ones who claim that CW can always get through. :-) Canada has recently removed all subband restrictions at HF. I believe that the same will eventually happen here. This shouldn't sound the death knell for CW. CW operators will be able to find many vacant 200 Hz spots in the spectrum to

practice their art. It may drive voice users crazy, but that's their
problem. Let them build notch filters.

While I share your enthusiasm for SHF, I must point out that wideband FM
is a much less expensive way to get started on the bands than CW. The
stablility and narrow IFs needed to effectively use CW aren't that easy or
cheap to achieve at SHF. Narrow bandwidths and ultra stable rigs are needed
for weak signal work, but weak signal work isn't the end all and be all of
SHF. I guess that, like racing, it improves the breed by pushing the limits
of sensitivity, but not everybody wants to drive an Indy car on the weekends.
I'd rather drive a truckload of data across town. :-)

I think there is a similar setup in the emergency control center in Raleigh, NC to allow 2m HTs to access the local repeaters from the too-well-shielded basement center. Perhaps someone more familiar with that setup could post?

I was told by one of the nurses at the cardiac center at George Washington Hospital that these antenna units were used to receive the heart monitor telemetry from the portable heart monitors that their patients wear when walking around the halls, or are on crash carts heading for help.

In a recent posting, Jeff Zell NK3O asked for opinions on VHF/UHF rigs.

I have has a FT-736R ever since they first came out (almost 4 years, I guess). It would be a very fine rig if Yaesu didn't try to cram everyting possible into it.
Basically, the '736 appears to have been designed with the following sequence of users in mind:

1. Satellite Ops
2. FM/repeater ops
3. Casual VHF/UHF weak-signal (SSB/CW)
4. Serious weak signal (contests, EME).

If your interests are near the top, the '736 is a great rig. It can do lots of tricks for satellites, such as automatic VFO tracking, full duplex w/out desense, etc.
It has a zillion (= 1.0EZ) memories and changing them is not terribly tricky. However, memories are NOT tunable.
For those of us at the bottom of the list, all the knobs, memories, and buttons just get in the way.

I have found that the rig is operationally fine - nice and stable, decent (but not outstanding) overload-handling on RX, and good-sounding TX. I have installed the 220 and 50 MHz modules, and they work just great. I do a lot of VHF contesting, and it's nice to have four bands in a single box. However, by the time I get preamps and power amps and relays and footswitches hooked up, there are STILL a lot of cables draped across the back of the desk.

Major drawbacks, from my point of view:

1. Adding relay-switched outboard preamps is a #1 MAJOR pain; invest in NEC/GasFETS.
2. Band switching is awkward - to get from 2m to 6m you have to go through 220 and 432
3. You can't copy SSB while in the CW mode, even w/o the CW filter
4. There is no provision for out-of-band RX.

5. I have been told that it's hard to connect to a TNC, but ask someone who has tried.
6. Incredibly, there is no provision for A=B with the VFOs.

There you go.

Phil,
I know, I know. Everyone agrees that if you get your 2 and 3a done before 2/14 you are entitled to the license. The only question is how do you get it done, there is NO process in place to do so.

The comments from KD9OF about the use of 17" inverted antennas in buildings is very accurate. These antennas are really PASSIVE REPEATERS for use with handheld radios. Ground plane antennas have been used for years by hams to gain outside access from basements and from inside buildings. I suspect that a ham was part of the installation team for the hospital that was described.

For those familiar with the tunnels on the Harbor Freeway transitioning to the Pasadena Freeway (Los Angeles), you may have observed wires on the ceiling running the full length of the tunnel (wires have been in place there for over 50 years). These wires are passive repeaters for improving signal reception from AM broadcast to 512mhz.

Using a passive reflector to allow communications over non line-of-sight (LOS) paths is really pretty common. To work best the reflector needs to be located in such a position that it intercepts a significant portion of the transmitted signal. This means that keeping it close to one end of the link and using a directional antenna to focus as much power as possible onto it is desirable. These conditions make particular sense in the uhf and microwave regions where very directional beams are most easily produced.

To get an idea of what you need, calculate what portion of the transmitted beam is intercepted by the reflector. You need to have an idea of the beamwidths(gain) to do this. This allows you to calculate the solid angle over which the transmit power is spread. Then see what portion of that power the reflector intercepts at its distance. If the reflector is specular (like a mirror) and positioned to reflect to the other end you now know the additional loss (beyond that of the LOS case) which would result.

Put another way, if you have enough LOS S/N margin to exceed the reflector's "intercept loss" then you will come out ahead.

If you only have a reflector which is dispersive (like a white sheet of paper instead of a mirror in visible light) then you have to calculate received S/N as though the transmitter were located at the reflector's location and running into an omnidirectional antenna instead of the gain antenna. Effectively you lose the columnating (sp?) originally produced by the transmitter's antenna. Columnation still serves to more effectively illuminate the reflector but is lost after reflection.

In locales with hilly terrain (like some rural areas here in Northern California) you can spot these "billboards" judiciously placed on hilltops to allow valley communities to get microwave communications in and out. If the hilltop isn't so far from the transmitter that the beam has spread out too much it can intercept enough power to allow reliable communications and it doesn't have the cost and maintenance problem that a full microwave relay would.

To calculate using yagis or other antennas as relays do the same thing as above for a specular reflector but use the antenna's aperture in place of the billboard's area. You'll discover why higher frequencies are favored, reaonable antenna size can provide narrower beams.

I don't know for sure but a quick calculation leads me to believe that the loss between an ER HT and the outside antenna might be 40 dB or less. Seems like that might be pretty worthwhile in many buildings which look like waveguide-beyond-cutoff and can have pretty tremendous attenuation to the outside world. (The one I'm in right now doesn't let a 3 KW ERP FM station LOS and 5 miles away in to the middle of the room even though I can see it!) That is probably enough to get to a dispatcher or a repeater located somewhere in the vicinity of the hospital. Perhaps more importantly it lets the paramedics here an incoming radio page.

The protocols really have no bearing on this. However, after working a little packet BBSs, I must say that the quality of the technology (software) and information content is less desirable than usenet or fidonet. (I would rank usenet 1st then fidonet.) I would really like to see improvement in the BBS software on packet. It is o.k. for message passing, but discussion groups just don't seem to work out. Maybe the solution is a TCP/IP based net running something like news. It seems like a good application for nntp.

Other VE groups may vary, but at least in the one I'm in, once you pay the test fee you can take any any set of elements you desire -- you get a new license, upgrades, or CSCE's depending on what you manage to pass.

If you pass the right tests for a new license or upgrade, your Form 610 gets sent in to the VEC, along with copies of the CSCEs. If you don't qualify for a new license or upgrade, the Form 610 gets returned to you, and you get any CSCE's for completed elements (again, with copies to the VEC).

(No one has ever asked to take a harder written element after failing an easier one, though.)

I once tried to connect two antennas together to act as a passive repeater, and it did not work. Here are the details.

On an ARES activity covering a wide rural area, 2m fm simplex was being used. The net control station could not communicate with one of the field stations that was down in a deep valley. I tried to fix that by going to a hilltop which had line-of-sight to both stations, and strong signals from both.
I erected 2 masts, each holding 8 element yagis ("Hilltoppers"), and connected them together using RG8/U coax. All these components were known to be working, as I also used them in other circumstances. The yagis were pointed directly at the two stations.

This made no difference. Neither station could still hear the other. I tried swinging the direction of the yagis in hopes of improving things. No help. So I gave up and manually relayed messages as needed.

Imade no calculations as to path loss etc, but I estimate the valley station was about a mile away downhill (I angled the yagi downward), and the other station about 10 miles away horizontally. The terrain was hilly, but both the net control station and I were on hilltops. The other stations were probably using 5/8 wave vertical antennas, on masts.

With the chance of a cheap air ticket for Easter time, I'm considering a visit to either the Caribbean(probably 8P9,J6,V2) or Seychelles/Mauritius.
Addresses for application are presently awaited from RSGB, however I wonder if anybody on this net has any experience/info of obtaining licences for foreign operation in the above places?
Any help would be greatly appreciated,

I've been reading with interest the notes from people who feel, as I do, that Radio Shack can do without my help in building up their database of names, addresses and phone numbers. More than anything else, it's a real pain to have to spend the extra time giving them all that stuff. I no longer fight it; I now give them what they ask for, the last four digits of my phone number...at work. I give them my real name and my mailing address at work. Now I'm in their database but I'm not bothered at home by anyone they care to sell it to. BTW, nothing yet in the mail from them here at work & I've been doing this for a couple of months, now.

Just use a discone. Simple, elegant, no gain, flat from 30 to 1000 Mhz. Ugly too.

To feed several separate antennas you'll need power combiners, matching networks, and bandpass and band-reject filters. You don't really want to do this. Since the antennas are for different frequencies, simple combining networks won't do. Without filters all the antennas will contribute some signal at each frequency. This will lead to some mighty weird patterns. Also without proper filters you'll be throwing away half your signal at each combining point. You may wind up with less than the unity gain of the discone even though all your individual antennas have gain. Doing this right can be expensive and tedious. You *really* don't want to do this.

>capacitor hence creating a stable environment. Second, never ever let the
>screen or any elctrode in the tube get floating. It's a way of asking for
>flashovers!

By running the cathode at a negative 1100 or so volts you've now got the problem of adequate cathode bypassing. Since the cathode circuit may be flowing an ampere or more of RF current this is a much more difficult task than bypassing the screen grid with it's one or two milliamperes of RF current. Also you now absolutely require a separate screen supply and you still must limit screen current to a safe value under all conditions.
In addition you must now supply a control grid voltage about 50 volts more negative than the cathode, yet another ground isolated supply, and now your input circuit must be designed to block a much higher than normal DC voltage requiring either link coupling or wide spaced variable capacitors or both. Running the cathode so negative runs the risk of filament to cathode arcing unless the filament supply is isolated from ground by at least 2000 volt insulation. This seems a rather high price to pay to avoid a screen bypass capacitor. Modern power tubes like the 8890 have annular grid rings and it is easy to make the socket so that the grid

fingers are attached to a sheet forming one plate of the bypass with the other plate being grounded and forming part of the output cavity wall. A thin mica or mylar sheet forms the insulation between the plates.

I agree that letting the screen float is a sure plan for disaster. If your screen protection circuit opens the path to your screen supply you must supply a shunt path to ground. A high value resistor to ground directly connected to the screen is a good idea when using a separate screen supply in any case. A steady load like this on the screen supply will help it maintain stiff regulation. A good value for this shunt is one that will draw a static current ten times the maximum allowed for the screen grid.

>Grouding the Screen is used by Collins many years ago in their amplifiers
>already. I'am running an EME amp using this method with no problems, even when
>I deliberate let it flashover, the tube survives...

What power tetrode are you using that doesn't mind flashovers? Most modern tubes are damaged by flashovers. Usually cathode material is sputtered onto the envelope and grid structures causing eventual failure through internal shorting. The problem is progressive, one flashover may not kill the tube, but each additional flashover deposits more material on the enevelope and grid structures eventually killing the tube through a short.

Which Hamtronics kits are you talking about? The TA51 exciters are $99 in kit form. That's only a factor of 2 different than $50 :-) Nonetheless, the Hamtronics kits are quite nice. I've built the 28 to 50 MHz receiving and transmitting converters. Good kits, etc. worth the price.

I'm leary of too many hams cutting their homebrewing teeth on off-the-wall 2m rigs. Imagine the mayhem a poorly designed/built radio can cause with respect to interference, etc.

Dana

My query is of interest to those sentimentalists (O.F.'s ?) of us who like to restore old valve radios.

I recently removed the plate glass tuning scale from a wireless (the glass sheet that sits in front of the tuning bar; the rear side of the glass supports a transfer which details all the radio stations for the various states of Australia, and frequency and logging scales).

In the process of cleaning it, parts of the transfer started to lift. I stopped everything and let it dry.

Once dry, the firm parts of the transfer are OK, but some of the thin lines which became loose have curled up, lifting off the surface of the glass.

I do not want to lose these bits, as the station information will permanently look damaged.

Can I use something to carefully 'glue' these small transfer fragments back onto the glass? Any ideas?

/\/\/\/\/\/\/\/\/\/\/\/\/\

SPECIAL SOLAR TERRESTRIAL BULLETIN

Artificial Aurora Alert

09 January, 1991

/\/\/\/\/\/\/\/\/\/\/\/\/\

At approximately 01:45 UT on 11 January (Thursday evening for the U.S. and Canada), an artificially created aurora will become visible over many Canadian and U.S. areas. Over most middle latitude locations, the auroral display will occur near the zenith (straight up). Southern Canada will see the aurora to the south of the zenith. Lower latitudes will see the aurora to the north of the zenith. Seeding will occur near 01:45 UT (5:45 pm PST, 6:45 pm MST, 7:45 pm CST, and 8:45 pm EST). There will be seven seedings take place, but the exact times of the other six seedings is not known.

This will be an excellent opportunity for people to observe an aurora. Much of the continental U.S. should be able to witness this aurora. Each seeding will produce a very intense aurora for approximately 5 to 10 minutes. To witness the aurora, get outside and away from city lights. Be at your observing site (ie. the countryside) by at least 01:15 UT to 01:30 UT. To observe the greatest auroral detail, give your eyes at least 15 to 30 minutes to become accustomed to the darkness. The auroral activity will be bright enough to capture on film, or to record with your Camcorder. Take hot drinks and warm clothing. The seedings may be spread out over several hours.

Radio propagation conditions during these periods of auroral activity will become notably disturbed over paths affected by the aurora. It may also be possible to accomplish auroral backscatter communications over VHF frequencies. Higher HF frequencies may also yield some interesting results. However, be aware that the auroral activity will be short-lived, hence any unusual radio communications achieved will likewise be short-lived.

PLEASE SEND A NOTE OF VISUAL CONFIRMATION OF THE AURORAL ACTIVITY IF YOU ARE ABLE TO SPOT THE AURORA. Send confirmations to "std_oler@hg.uleth.ca". Please include your observation location and a brief description of the activity you witnessed.

PLEASE ALSO SEND ANY NOTES OF DEGRADED RADIO COMMUNICATIONS TO THE SAME ADDRESS GIVEN ABOVE. Again, please state your transmitter or receiver location and a description of the radio anomalies experienced (strong fading, intense flutter, distortion or noise, etc.). Also please state the frequencies affected during your observations.

To all who send confirmation reports, thanks very much!

NOTE: Although scanning is usually discussed in rec.radio.shortwave, there have been several scanner related questions in rec.ham-radio lately so I'm posting this article to both groups this month.

Introduction to Scanning

by Bob Parnass, AJ9S

This introduction is intended for people new to the scanning hobby. It tells where you can buy your first scanner, what features it should have, how to get frequency information, and mentions a few scanner clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, armored cars, trains, taxis, airplanes, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Listen to your neighbors deal drugs over their cordless telephone, or as their conversations are picked up and transmitted over the airwaves by their sensitive baby monitor intercom. Yes, it's legal to listen, and it's all there in the 46 and 49 MHz ranges.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Listen to airline pilots as they talk with air traffic controllers and their companies between 108 and 137 Mhz.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, and a few other types of communication, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the ECPA.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that California, Florida, Indiana, Kentucky, Michigan, Minnesota, Nebraska, New Jersey, New York, North Dakota, Oklahoma, South Dakota, Tennessee, and Vermont have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $7.50 from ANARC Publications, P.O. Box 462, Northfield, MN 55057.

What Scanner Should I Buy?

Radio Shack, Uniden (Bearcat and Regency brands), and Cobra offer a wide choice of scanners. Personally, I don't recommend AOR brand scanners.

Scanners are available in two varieties: crystal controlled and programmable. The crystal controlled models are cheaper, but require the user purchase and install a $5 crystal for each frequency of interest. Programmable (synthesized) units don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system.

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band unless you live in a very rural area where this band is not used. Usage of the 800 MHz band is growing by leaps and bounds.

If you're not sure whether you'll like scanning, don't want to spend much money, a 16 channel radio will do. In general, the more channels and banks, the better.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to most scanner owners.

Currently, the more popular scanners include the Uniden/Bearcat 760XLT (a/k/a 950XLT) and Radio Shack PRO-2004 and PRO-2005 base/mobiles, and the Uniden/Bearcat 200XLT (a/k/a 205XLT) and Radio Shack PRO-34 portables.

All scanners come with a built in antenna, permitting reception up to about 20 miles or so. Outdoor antennas can extend reliable reception to 100 miles or more.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Service Merchandise, McDade, or Bell sell scanners, but carry just a few models. Department stores, like Sears and Montgomery Wards, sometimes offer scanners, although at high prices.

The best deals on new scanners are from reputable mail order firms like Grove Enterprises (Brasstown, NC), Scanner World (Albany, NY), or National Tower Company (Shawnee Mission, KS). Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI), also sell scanners. See the shortwave "welcome" article for the addresses of other scanner suppliers.

Used scanners may be found at hamfests, flea markets, or listed in the classified advertisement section of your newspaper.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is the Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for about $7.

I also recommend Richard Prelinger's 1985 book, Monitor America, published by SMB Publishing, and available from Grove Enterprises for about $15. Although somewhat out of date, this single edition contains 582 pages of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 6th edition is available from Grove Enterpises for about $19. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications. The best frequency lists are often found in club publications, discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Three models, the ICOM R7000, Bearcat 250, and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-75 or CTR-82 will do. It's best to use a shielded cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the

RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $18.50 per year, which includes a monthly newsletter of about 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. Club policy precludes printing certain sensitive federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

One club which does print sensitive federal frequencies is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

Annual dues are $15 and more information is available from All Ohio Scanner Club, 50 Villa Road, Springfield, OH 45503.

Simon, contact W6YA here in San Diego County. He recently operated from Seychelles and got the call S79YA there. He also went to Mauritius, but had to be content with using a local station on a very low visibility/activity basis. Apparently you have to be a native-born citizen to even be considered for ham radio there. I think Jim can give you the details of what he could and could not do, but he's not on this net.

Speaking of kits, when I was at the 'Q'* the other day they had some neat little kits made by Ramsey Electronics for $25-$35 each. Has anyone tried building these things? They had a bunch of QRP transmitters, keyers, and receivers and people were buying them almost as fast as the guys could stock the
shelves! (This was right before Xmas - mothers were probably buying them for their kids...) I would have bought one but they were sold out of the ones I was interested in!

No DSP kits for 30 bucks though. :-(

AOR AR1000

PORTABLE SCANNING RECEIVER

Introduction.

This is a review of the AOR AR1000 portable scanner (which is similar, if not identical to, the Fairmate HP100E). Comments and opinions in this review are those of the author.

Description.

The AR1000 is a small hand-held scanner covering the frequency range 8 to 600MHz and 805-1300MHz in two bands. Reception modes are AM, FM and WFM, selectable independently of the receive frequency. Scanning steps can be programmed from 5 to 995KHz in 5 or 12.5KHz steps.
10 banks of memory are provided, each with 100 locations.
Power is supplied either from four internal 'AA' cells (Nicads are supplied) or external 11-15V DC supply.

In Use.

As supplied the AR1000 comes with each bank of channels pre-programmed, this being as follows:

BANK	USE	RANGE	STEP	MODE
1	VHF Air	118-138MHz	25KHz	AM
2	UHF Air	225-400MHz	50KHz	AM
3	PMR LO (*)	71-87MHz	12.5	AM
4	PMR HI	165-174MHz	12.5	NFM
5	BAND3 (*)	174.5-225MHz	12.5	NFM
6	MARINE	156-163MHz	25KHz	NFM
7	HAM VHF	144-146MHz	12.5	NFM
8	HAM UHF	433-435MHz	25KHz	NFM
9	C-MOBILE	890-905MHz	12.5	NFM
0	C-BASE	935-950MHz	12.5	NFM

(*) note that in Europe, 71-87MHz is used for private mobile radio and 174-225MHz is for trunked mobile radio services.

Each bank can be scanned separately, or in groups (so, for example,, you can limit scanning to banks 1 and 2 when you are at an airshow, or banks 7 and 8 when at a ham meet). Lockout is available to prevent the scanner halting on certain frequencies - note that this is not an automatic 'skip blank carriers' mode liks certain other scanners, instead you have to let it stop on a blank carrier and then hit the LOCKOUT button so it does not stop on that frequency next time round).
Up to 100 lockouts can be set per bank.

It is possible to reprogram the bank limits if you do not like what is supplied, although the front panel comes engraved with the designations given above...

In search mode, the speed is approx. 35 steps/second. Frequencies found in search mode can be stored in the relevant memory location by pressing ENTER followed by the (3-digit) memory location you want to store to. Note that there is no way to store a frequency you have found in 'the next free memory location'.

When scanning memorised channels, the rate is approx. 18 channels per second.

When searching, the direction of search can be altered by using the UP/DOWN keys (default is to search from low frequency to high but this can be reversed). There is a knob on top of the radio which can be used to search manually; this is very useful for fine-tuning (for example if searching with the radio set to 5KHz steps it will often stop off frequency when it detects a strong signal - the knob can be used to accurately centre the tuning).
Knob-operation is also possible to step through memory channels in either direction.
When stepping through memory chanels, pressing the MANUAL key then allows you to step up or down either side of the memorised frequency in whatever increments you choose. You can also change modes when in MANUAL mode.

Any memory channel can be allocated as a priority frequency, which is sampled every 2 seconds.

Practical Use

In practice, the RX is extremely sensitive - it receives fully quieting signals from a cellular base-station over 2 miles away *without an antenna*. Using an external dual-5/8 collinear for 2 meters does result in slight intermodulation (this is to be expected - i am line of sight to a paging TX and a FM broadcast mast) but the manufacturers have conveniently fitted a 20dB attenuator, invoked by pressing a button, which removes the problem. I can use this receiver in RF-hostile environments with little or no desensitisation; it is superb in comparison with the Icom IC-R1 which desensed with just a 1/4-wave whip.... I can even use the AR1000 with its supplied 'stubby' rubber antenna to listen to local FM broadcast stations whilst working 2-meter packet, with no ill effects. Its *usable* sensitivity is far better than the IC-R1 in a practical sort of world. I do not have a lab to test 'ultimate' sensitivity but in comparison with a borrowed TH77E, the AR1000 stood up well - it could hear anything the '77 could.

Clearly, front-end filtering *CAN* be made tight without sacrificing sensitivity or frequency coverage.

Adjacent-channel selectivity is good, bearing in mind the amount of 12.5KHz channelling in use. Only on a couple of occasions has there been any adjacent-channel interference noted.

Now to the bad points.... the 'If only's. You knew it couldnt ALL be good!!!

Controls - well, the 'keyboard lock' is done through a key that has a raised lip round it to prevent it being pressed accidentally. If you are wearing gloves, it is impossible to press!
Secondly, there is a display illumination key - when pressed, you get 7 seconds of display light... not long enough to enter a frequency!
The display light is just that - a display light. In the dark you have to guess which keys are which, using touch.
Holding the 'display light' key down doesnt achieve anything, as the light still goes out after 7 seconds. If you are trying to enter a frequency in the dark, wearing gloves, you have problems. I would prefer the 'keyboard lock' and 'display light' functions to be done via small slide-switches, like on my old Regency.
Thirdly, power & batteries. The Nicads last about 4 hours with reasonable audio volume. No, its not 'nicad memory' thats getting me, as i have tried several sets of cells. If the radio had been made bigger, and used 'C' cells rather than 'AA' then it would have been better....
The external power jack is on the side of the radio, making the use of a 'drop in' charger impossible. Easy recharging in a mobile environment is therefore not possible.
Now if only the manufacturers had seen fit to install contact studs on the base of the radio.......

Finally, the last real gripe; when operating on the HF bands, it is usually impossible to tune a broadcast station accurately when you only have 5KHz steps available. a 1KHz or 0.5KHz step size would make life so much nicer.

Conclusions
~~~~~~~~~~~

Overall, I like it! The resistance to spurious intermodulation effects and superb sensitivity make up for the minor niggles regarding the keypad and illumination/lock controls. Now if they only made it take bigger nicads, designed a 'drop-in' charge facility, and gave it 0.5KHz scanner steps, it would be ideal.

Lines: 110

Just bought a RF Concepts 2/70G (2m/440 MHz w/preamp) linear for my HT (ICOM 24AT) so I thought I'd write a few words about it.

So what is there to say. If you have a 24AT HT you know that this baby really "cooks" running full power on 13.8v. In fact, I'm looking forward to using this as a hand warmer when it *really* gets cold here in Chicago. And, it is a good "timer" to disuade rambling QSOs that might otherwise be deemed monologues.

Seriously, the 24AT just can't effectively sink the heat generated by the 5+ watts of output on 13.8v. Also, I wanted to get a bit higher power for my car and getting the dual-band linear was cheaper than buying a dual-band mobile rig.

The power out is pretty much as expected. (Although my 24AT does seem a bit "low" on 440 MHz). Here are the results running the 24AT and linear into a dummy load.

2 meters

24AT power setting	24AT (Watts)	w/linear (Watts)
low1	.4	4.5
low2	1.5	15.0
low3	3.8	22.0
high	6.0	28.0

440 Mhz

low1	.2	2.6
low2	.7	6.5
low3	1.8	6.8
high	2.9	11.0

There are two models of the RF Concepts dual-band HT linear. One with, and the other without the preamp. The cost difference is about $20. I went for the preamp.

Amazingly, the preamp makes quite a bit of difference. In fact, its about a 2 to 3 S-unit difference. And, scanning with the preamp brings in stations that I couldn't even hear before.

Now For the Bad News......

SWR Protection

The user guide makes a big deal about high SWR and having the proper type of antenna attached. The "other" RF Concepts linears have high SWR stutdown protection. This unit seems not to have implemented high SWR protection to the extent that the higher power RF Concepts linears have (such as the 170 Watt 2m unit). When the user manual makes that big of a deal about warning about high SWR - it scares me. Why not just spend the extra $$ to implement good SWR protection than fry the linear ? Accidents do happen - shorted coax or whatever.

Transmit Power Degradation

You can use your HT hooked into the linear with the linear power amp switched "off". (Pre-amp and linear are independent). In this case the signal is routed through the linears switching relays (mechanical) and out through the antenna jack. My initial measurements show that you may loose as much as 30% of your signal. Worst was 440 MHz band where I measured 2.9 watts out from the HT into a dummy load, and 2.0 watts out into a dummy load when routed through the linear powered down.

Receive Signal Strength Degradation

Insertion loss is about 1 S-unit on receive with the pre-amp switched off.

Conclusions

Power out on 2m is expected. My power out on the 24AT seems a bit low but I have no doubt that the RFC 2/70G would put out the rated power on 440Mhz if I had sufficient drive. (440 Mhz 5W in / 20W out; 2m 5W in / 30W out)

Insertion loss is a bit much both on transmit and receive with the linear and/or preamp turned off. But, why would anyone want NOT want to run the linear ? ... especially with the large number of power levels available on the 24AT. The preamp is another matter. In the city, the preamp will pull in alot of stray signals and intermod. For stations that you can already hear the 2-3 S-unit difference won't make any difference. But, as I mentioned, that 2-3 S-unit difference does make a big difference for stations that you can't hear at all - now. You probably won't be able to talk (transmit) to these people... but if you're into monitoring.. then you're all set.

The warranty is confusing. The AES catalog says 5 yrs and 6 mo on the RF transistors. The label on the box that the linear came in says 1 yr / 6 mo. And, the user manual had the entire page that discussed the warranty and return policy "crossed-out". I called Kantronics and in fact it is a 5yr/6mo warranty.

You get a schematic (always good for prying fingers) and a 2 page mini-lesson on RF amplifier design. If you want to mess with the RF peak detector, resistor divider and comparator circuit that trips the transmit relay on other than the factory set .4W then you'll find that the technical writer has not forgotten you.

All in all, I'm satisfied. I now have mobile-rig level power from my ICOM 24AT at 1/2 the price that a dual-band mobile rig would cost. And, I can now also carry on a QSO using my 24AT in low power without it suffering thermal meltdown or me suffering 3rd degree burns.

RF Concepts (Kantronics) 2/70G dual-band HT linear w/preamp - $239
from AES in Milwauke.

Greetings from KB3ZW... If you have an HR-2600 or for that matter an HR-2510, you might better think twice.   The fact of the matter is if you increase the FM power to 50 watts using the CW power pot, and or the AM power to 50 watts, you might want to plan on replacing C17 on the output circuit.   If the power on FM, and AM is increased to approx. 40 watts, the capacitor will blow in about 30 seconds. I think the capacitors are under rated. I replaced it with a 15pf 15kv cap, and observed that the toriods on the final output generate a lot of heat.. DO NOT believe the SWR meter on the rig is not accurate. I noticed when the SWR is actually 3 to 1, the meter only reads 1.5 to 1.

If you want to crank up the power, it would be better to leave the power level on FM, and AM, about 20 watts and no more. Although the heatsink can effectively dissipate heat generated by 20 watts, I would suggest one of those 12 volt fans that can be purchased at Radio Shack, if you plan on going any higher on the power output.

I put the 2600 on a spectrun analyzer after I replaced the cap, and found a clean output. I took a chance on cranking the FM power up to 50 watts, and found that when the outputs start getting hot, the output starts to get a little dirty, and the rig starts to draw current gradually. The specs on the final output show that the device is only rated at 40 watts. If you want more power on the HR, get an amp, and don't find out the hard way.

Any additional input, is greatly appreciated. And by the way, cranking up the SSB power seems to be ok.....

Ta-Ta for now,
73's John. KB3ZW

Anyone out there have one of these things? It's the optional waveform monitor scope for the Kenwood TS-940 and TS-440 HF radios. I've got a chance to pick one up for a considerable discount (almost 50% off the

```
$550 list) and I'm looking for advice and comments. BTW, the one I'm
being offered includes the BS-8 panadaptor module.
Thanks & 73,

Homebrewing can be much cheaper if you use 'salvage' techniques! Never throw
anything away - it will always come in useful. Hanging around your local
mobile-radio dealer will probably get you a few strange looks, but may also
get you some ancient-but-usable high-band mobile rigs for next to nothing -
these are an excellent source of PA transistors, filters, amplifiers etc,
or you may be able to rebuild several such radios into one working rig.
Do not despise tube stuff! The old GE, Motorola etc. radios were built to
take some pounding, and even the filthiest ones often come up clean after
a cycle in the dishwasher(!) followed by gentle drying (borrow the XYL's
hair-drier?) and theres plenty of room to add your own flavour to the chassis
on top of whatever the maker originally intended.
If you are into HF, try digging out sixties-style tube CB sets - these are
infinitely more understandable than solid-state synthesized equivalents,
and have plenty of space under the chassis for your own creative urges to
be fulfilled. AM CB sets can usually be phase-modulated with a varicap
diode (or a tube reactance-modulator) across the crystals, and being tube
based, will not expire if you forget to connect the antenna.
Add a 'Class C' PA made from an ex-TV sweep-tube, and you have a reasonable
10-meter FM/CW rig that can run nearly 100 watts....
Old tube broadcast-radios from garage sales can be converted to 160-meter AM
transmitters particularly if you get a 'deluxe' model (convert one of the push-
pull audio output tubes to a class 'C' PA, convert an IF stage to a driver
stage, feed in the l.o. signal, and use the other push-pull audio tube
and the output transformer as an AM modulator - typically you will get
10 watts of RF from a tube such as a 6V6 or 6BW6. Put a key in the PA
```

cathode, and you have a 160M CW transmitter).
And of course, nobody ever BUYS an antenna(!); they make it, 'Plumbers
delight' style out of aluminium irrigation pipes, copper plumbing,
exhaust muffler clamps, scrap TV masts, old phone wire etc.

I spent 9 years with Tandy in various positions of lowlife, manager,
regional offices, even in R&D. I can't tell you what CURRENT policy is
but I can tell you what it has been in the past.

Radio Shack policy is not to force individuals to give name and address. It is to be POLITELY REQUESTED, and if the customer refused, the sales person was SUPPOSED to write refused on the ticket. This obviously was before they installed the custom 1000 units as point of sale machines. Stores do NOT get paid for names and addresses, employees do NOT get paid for names and addresses. HOWEVER, a fixed percentage of store sales goes for flyers, REGARDLESS of how many are actually mailed from Ft Worth. This means managers are pressed to get as many as possible to get the highest return on their advertising dollar.

Employees ARE rated on their percentage of names and addresses, or were with the written tickets. And while they weren't paid, it wasn't uncommon for District Managers to have 'contest' for this, giving small items for the highest each month, and maybe stuff like a reveiver or even a computer for the highest for the year.

With the advent of the point of sale system, control is taken from the sales employee, but I bet there is a 'procedure' to say refused, but I'll also bet thatnot 1 in 10 employees know how to do it at the terminal.

I'm in the early stages of designing a WEFAX system for my shack. I have read Taggart's book (good info, his design is REALLY dated, more below) and have a pretty good understanding of what needs to happen in a WEFAX decoder.

Now i'm evaluating alternatives for a receiver. Scanners are out (except maybe the ICOM R9000 and with my lotto luck here lately, well....) so i'm looking at a dedicated receiver. I took Taggart's advice and got a Hamtronics catalog. I like the prices. My question is:

"Is Hamtronics stuff any good?"

Replies via personal EMAIL, summary for >5 responses.

Now, to respond to a couple of people who were asking about WEFAX decoders. IMHO, if you're going to do a lot of WEFAX, build a dedicated system. Tying up a PC to do this is kind of excessive. You can always modify the dedicated decoder to make the bitstream available serially to your computer for further processing/enhancement/storage/printing. For simple display, the scan convertor is a good idea.

My problem with Taggart's design is that, while granted it's cheap (6809's can be had for $3 from surplus places) it doesn't take advantage of some of the newer graphics chips and microcontrollers that can be had. The demodulator is really cheap to build. It just uses a couple of op-amps and an A/D converter.

I'm looking at replacing most of his CPU with a microcontroller and a CRT controller of some kind. Just add a surplus video monitor and a receiver for WEFAX decode in a standalone unit.

I noticed someone commented about using a DSP system for this. That would ideal since you could program "software" filters and maybe even do enhancement right there in the DSP chip. Unfortunately, my math background is not nearly adequate to DSP (after I complete undergrad work, i'm going to do something about that) so mine won't have that. I'd like to see a DSP-based WEFAX decoder if someone does do one.

I think a WEFAX decoder is a great homebrew project. The project is complex enough to be challenging and yet can be done with fairly modest components and equipment. Taggart's book is required reading for this project.

I look forward to comments from the net.

This info is a bit out of date, I'm afraid. I believe that Hans has shut down this operation (which was a one-man shop). However, a company called Sinclabs (associated with Sinclair Radio, a manufacturer of commercial antennas, duplexers, etc) is now marketing a line of transverters based on Hans' design. So far they only have 28/144 and 28/220 models, with a 70 cm unit coming soon. I don't have the address handy right now, but they've had ads in most of the recent ham mags.

Here is a reprint of an article I posted a few years ago:

A LOW COST PANADAPTOR
FOR THE R-7000

by Bob Parnass, AJ9S

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a subcarrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the intermediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC voltage is also present at this connector and is used to power an ICOM TV accessory.

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal monitor, priced at $1600, and reviewed in May 1987 "Monitoring Times".1 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.2 Bandwidth adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an inductor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted aligment controls that get the display to behave as specified in the owner's manual:

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the horizontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest signals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find the proper point in the IF stage (before filtering takes place), install a connector, then wire a DC blocking capacitor between the IF stage and connector.

I worked for several years at Radio Shack when I was in college, starting in the mid 70's and people were bitching about the name and address thing then too. Dont you guys like being on the RS mailing list? I do. It's nice to get the sale flyers before they hit the papers so you can visit the local RS store before they sell their entire stock of one unit. As for their new computer system, I love it. Once you get into 10 of 15 stores you never have to recite the old name and address again!

How about some reverse bashing? You know, not everyone behind a Radio Shack counter is an idiot. Of course, I guess it depends which side of the counter you're looking over. Anybody out there have an RS "Battery Club" card? Those were fantastic for placating irate customers- especially if you marked off the previous and current month and gave them 2 D-cells! And then there were the people who came in like clockwork for a free battery. It was fun to "forget" to mark off the card. You could usally tell which people would warn you of your mistake and which would slink out the door like they had just stolen the crown jewels.

I suppose none of you have ever stopped in to pick up your FREE flashlight. I always do- it's worth it just for the spare light bulb! One year (1975?) RS made the triple mistake (in St. Louis) of overprinting coupons, having an extended redemption date (12-31) AND understocking flashlights. You have never seen so many people so pi**ed off! I swear, they thought if they could force me to squat that flashlights would come popping out!

Oh well! I'll give this subject line a couple more days before it joins the KILL file.
-Ken WB0QNA

Hi,
sometime in the near future I will be visiting ST. Thomas in the U.S. Virgin Islands for vacation with the xyl to celebrate our 15th anniversary. I will be taking my 2meter ht with me.

I was wondering :

1) Does anyone have the repeater frequencies and splits used on the island ???

2) Does anyone know of someone who I could contact to learn more about hamming on the island and perhaps guest operating on an hf rig ???

3) Does anyone know what the proper way of signing is there if I want to use portable xxxx, or a kb2gcg/xxxx. I know it is no longer required (please let's NOT get into that whole discussion) but it would be kind of neat to let people know where I was operating from via call sign.

Thanks in advance for your help.

As a followup, I just found out from another posting in another group, the point of sale system in the RS store DOES have a way to refuse the name and address. Just hit <F3> and the system will not use it.

On another note, I went into a local RS and the guy was rushed and DIDN'T ask for my name and address, he just hit a random phone number and selected the first name. Some may like this, but what about returns and/or refunds? What about a warrantee if the purchase was bad? Should be no problem, but hey, it COULD be a piss. Also, what if I needed that receipt to get company re-imbursement? That pissed me off even more.

I need a little help with the RTTY program Ham Comm.

1) it does not seem possible to select COM1 or COM3 from the menus. Why?
2) the program locks up my laptop quite often. Has anybody had the same type of problem ?
3) is there some kind of extra documentation file available somewhere ? the program looks very nice but the help file is very short.

Thanks, Marc.

The following is part of the text of an article that appearred this week in FidoNews <tm>, the weekly newsletter of the amateur computer network called Fidonet <tm>. I am reproducing it here to demonstrate that the fears that only radical outlaw CB'ers will be attracted by the codefree license are unfounded.

Jack Decker

FIDONET IN 1991

Well, here we are at the start of a new year. What will 1991 bring for Fidonet?

This could turn out to be an interesting year. Perhaps the biggest event may go almost unnoticed by most. It came in the form of a news release from the Federal Communications Commission:

December 13, 1990

FCC ESTABLISHES NEW CODELESS CLASS OF AMATEUR OPERATOR LICENSE
(PR DOCKET 90-55)

The Commission has revised the examination requirement for the Technician Class operator license, thereby creating a new codeless class of amateur operator license. After these revisions have become effective, an examinee will not be required to prove that he or she can send and receive texts in Morse code telegraph signals to qualify for a Technician Class amateur operator license.

The amateur service currently consists of five classes of licenses having increasing privileges and each being progressively more difficult to obtain. The classes are Novice, Technician, General, Advanced, and Amateur Extra.

The FCC noted that offering a codeless class of license that authorizes control operator privileges at stations which transmit exclusively above 30 MHz, provides an entry level opportunity to otherwise qualified persons who find telegraph a barrier to pursuing the purposes of the amateur service.

Therefore, the FCC has established the Technician Class as the codeless class of license. This license includes all amateur privileges above 30 MHz. The Commission also amended the rules to grandfather frequency privileges below 30 MHz to current Technician Class licensees.

In addition, the Commission decided to retain the Novice Class operator license in order to provide an alternate entry level operator license opportunity to persons who desire to pursue the purpose of the amateur service and who can pass a telegraphy requirement in place of the more comprehensive written examination requirement for the codeless Technician Class operator license.

Action by the Commission December 13, 1990, by Report and Order (FCC 90-///). Commissioners Sikes (Chairman),

-FCC-

[end of news release]

What does this mean, and why is it important? Well, for the first time folks in the United States will be able to get into the hobby of amateur radio without taking a morse code test. It is impossible to know how many will take advantage of this opportunity, but it could make a difference if those with an interest in technology are drawn into amateur radio. As you are probably aware, amateur packet radio technology allows data communication via radio that are very similar in many ways to what we do via phone lines.

I'm not an amateur (not yet, anyway), but as I see it there are four noteworthy things to keep in mind about amateur radio:

1) They use protocols similar to those used by the Internet (e.g. AX.25 which is a takeoff on the X.25 protocol). Thus, folks who get into amateur radio will probably be more at home in the UseNet environment than in Fidonet.

2) There are no long distance charges in amateur radio. Thus, it may have great appeal to those in rural areas. Those using amateur radio for data transmission need not be quite so concerned with shaving every last byte off of a transmission in order to save phone charges (I'm not saying that efficient protocols should not be used, but it's simply not going to be quite as big a concern). The fact that phone charges are not an issue may mean that there are fundamental differences in the way traffic is moved via amateur radio.

3) No commercial traffic may be carried over amateur radio. Thus, certain types of conferences that are routinely carried on Fidonet could not be carried via amateur radio (at least not without significant changes in content).

4) Again, I must point out that I'm not an amateur, but it seems that one of the problems with amateur radio is that many hams seem to want to talk only about amateur radio, and nothing else! We have those types in Fidonet, too, of course - the folks that participate only in the computer- and communications-oriented conferences. But in Fidonet, there are conferences on a fairly wide range of other subjects as well. I'm not sure if amateur radio has this diversity now, but if it doesn't it probably will.

Those of you that are hams may find some glaring errors in what I've stated above; if so, please understand that I don't claim any expertise on the subject. My only point in commenting on this at all is to point out that while amateur radio will never completely replace Fidonet, it could certainly affect us. Indeed, it has already (some have commented that the now defunct IFNA [International FidoNet Association] was intended to be to Fidonet what the ARRL [American Radio Relay League] is to amateur radio. Since the ARRL seems to be the organization that many hams "love to hate", I'd say that IFNA at least partially achieved its goal!). But now that the psychological barrier of the code has been removed, it's quite possible that many more of the technologically-knowledgeable people in Fidonet will be inspired to bone up on small amount of electronic theory knowledge required to get a ham license.

This cross-pollination of the two technologies could ultimately
affect us in ways we don't yet realize.

If you have hard-wired (not dialup) access from your machine to the
net, give the command:

```
telnet marvin.cs.buffalo.edu 2000
```

or if it doesn't "know" about marvin try:

```
telnet 128.205.32.4 2000
```

Then type 'help" for instuctions. The data is 15 months old but should
be updated soon.

No. If they advertise something for sale or display it with a price
on it, they have to actually sell it to anyone who offers to pay that
price. Otherwise it's misrepresentation.

>anti-CW attitude will always prevent you from meeting the kind of people you say

Huh? You're attributing to me attitudes and beliefs that I don't have.

I *do* use CW. Anti-CW attitude? Well, I don't think CW is the only mode
that exists any more, but I use it and fully appreciate its technical
advantages.

Why the knee-jerk reaction?

I don't advocate "destroying" CW in any way, shape, or form.
All I advocate is a reduction of Morse code exam *requirements*.
Let CW stand on its technical merits rather than forcing people to
master it (we don't force people to use any other mode).

We should perhaps continue this on 21.060.
I'm not the character you think you're arguing with.
I'm into QRP CW and homebrewing!

What I meant by "fast CW snobbery" was the attitude -- very widely
expressed in the no-code debate -- that "I can receive 20 wpm and that
makes me a superior person and knowing how a radio works has nothing
to do with it!!!" And there *are* plenty of people with that attitude,
who think they "earn" ham privileges merely through fast code speed.
You do not appear to be one of them, but they do exist.

This pointless, meaningless, moot, boring, run-in-the-ground code/no-code debate SHOULD END....NOW! But....uh....I have another clever thought or two about it - before I insist that YOU PEOPLE SHUT UP. Or should I tell you about that incredible aspect of ham radio I enjoyed most as a youngster.....which I think should be an absolute requirement for ALL hams today? I can't decide. Does anybody (except you mindless, obsolete, irrelevant Old F**ts) know what a *brown 807* is? So.....forget the whole thing!

OK, I'm just kidding. This is a most interesting, and informative list. Ham radio has always offered conflict, debate, humor, wit, intellectual stimulation, and collegiality - as well as a wonderful opportunity to learn and be tested over skills and information which the next generation always views as obsolete. This forum certainly maintains those traditions - and in a very enjoyable format. Just wish I had the time to participate - even to carefully read all the postings!   (what kind of jobs do you guys have, anyway???)

Debate concerning how this hobby will, and should, evolve - esp. the PROCESS by which this occurs; rules and regulations, licensing structures and requirements, spectrum allocations (of course), philosophies concerning growth - inclusion/exclusion, waivers, etc., should continue endlessly. Without it, the hobby as we know it will certainly die. Eventually, we will all be debating the merits of dropping all of the arbitrary and *irrelevant* barriers to participation and having to rationalize exclusion on ANY basis. The first ammendment ultimately comes into play...right?   Like...what RIGHT do you have (man) to tell me how much RF I can emit, and on which frequencies; and what modes of modulation I can and can't use???? (Is this America or not???)

Relevance needs to be continually questioned, and assured - esp. concerning people and their interfaces to rapidly changing technologies. In my business, programming aptitude was once a prime requisite for effective computer utilization. Today, it is almost totally irrelevant; and has been for much longer than it took us to realize.....and admit it! Most people that I know today, making effective use of computers, have no programming skills whatsoever. If they had to write programs, they wouldn't be using computers.

Relevance, on the other hand, should not get confused with *expedience*. The educational systems in America may never recover from our misguided efforts, beginning in the mid-sixties, to make it all *relevant*. Worse....our SOCIETY may never recover either. The pipelines are empty - at least of young Americans. Advanced science apparently isn't relevant. Graduate schools are catering primarily to foreign students. Many of them will leave this country and use what we have given them against us. Thank God though for American *freedom* and *enlightenment*. Our boomers have never had ANYTHING shoved down THEIR throats. We left if all up to them. If it didn't feel good - RIGHT THEN - they weren't required to do it.

The aging ham population is but one small aspect of a much larger societal challenge. How do we get boomers excited about being a part of ANYTHING (which wasn't invented in their lifetime)? How do we get them to see relevance in history, tradition, continuity.... the interests and needs of others?

Well, time for my Geritol and afternoon nap. 73zzzzzzz.

It's preventive medicine, rather than a cure, but......

If you never turn the mike over (observe the way you pick up & put down the mike -- you'll be surprised) or (if you have a long telephone handset cord) do the same thing by stepping over the cord (i.e. walking in a circle), then the cord will take a very long time to kink. Ideally, never.

However, to me the prevention is worse than the problem. Paying enough attention to my (habitual) mike-handling takes more effort than periodically unkinking the cord.

Such is life.   -73   Skip AA6WK

Bill,
It so happens that he does belong to the ARRL VEC. However, the issue is not if someone is qualified. He agrees, if you have passed elements 2 and 3a and it is now 2/14 you are qualified for a technician class license.

The problem is that there is no PROCESS in place to handle people who pass these elements prior to 2/14. How does a 610 get generated after 2/14 if no additional elements are taken and passed ???!!!

Hi,
I also started out with a simple rig, the Heathkit HW-101, the succsessor to the sb-101. It did have some little extras, but because it is so basic, it forced me to learn more about tuning up and understanding how a radio works. BTW, sometimes simple is fine, with just some casual use I have made some 40 DX contacts on voice 10M.

About a month ago I finally upgraded to a ts-430.

There has been interest by some or one netter to build a 2 meter tranceiver.... It can be done easily and cheaply using some modern Intergrated Circuits from our friends at Motorola.

You can build the transmitter from a MC2833 Low Power FM Transmitter System and the receiver from a MC 3362 Low Power Dual Conversion FM Receiver chip. Recomend that you get the Motorola Linear and Interface Integrated Circuits handbook DL128 REV 3 It has lots of interesting things.

If you need any help call or e-mail me direct I'll be glad to help. I am basically a RF type and will be glad to check out your transmitter before you put it on the air.

I can help you out with parts and data sheets as necessary.

Recently I installed the 12/17 meter kit to the antenna. What a disappointment, same problem.

So if I was to do it all over, I would get the R5 for 10,12,15,17,20

meter operations and put up a wire antenna (sloper, long wire, etc) for
40 & 80 meters. This combination will give you better performance on
all bands than the Butternut...

Have fun!

Phil

Someone recently (but not TOO recently!) posted a mod to the Outbacker
where you replace the tuning whip at the top with a much longer one for
another antenna, then plug the loading cord into a different hole.

I now need that article, and it's expired on our system. Could someone
(like the original author, maybe!) forward it to me? I'm asking on
behalf of Steve Roberts, of Winnebiko fame.

Where can I get instructions for the known modifications for various
VHF/UHF radios?

More specifically: Is it possible to get BOTH standard 12.5/25 MHz
step and "unlimited coverage RX" simultaneously on an IC-u2?

I have a modified IC-u2ET which steps by 5 kHz only when the band
limits have been removed, and I'd love to get either 12.5 kHz or 25 kHz
step for convenience.

Thank you.

I have been told by a local ham that there is a rumor circulating that DRSI has filed for bankruptcy.

Can anyone confirm/dis-prove this??

If it is true, is there anyone located near DRSI that could find out if they have a lot of cards to liquidate. I for one would still buy their cards and will greatly miss them when they are gone.

>
>73 de W3GRG - steve

I own the Butternut HF6VX, and have a friend with an R5. The Butternut needs radials, since it is a quarter-wave on 80/40. On 20, it is a half-wave, just like the R5, except that it has another half-wave reflected in the groundplane (which I've heard gives you a little more gain).

The advantage of the HF6VX is that it offers multiple quarter wave operation on 10/15/20 (slightly more gain). There are no traps - the whole antenna radiates on all bands. The disadvantage is that it requires radials to perform well. If you intend to move the antenna a lot, you probably want an R5, and use a horizontal wire loop and Transmatch for 40/80/160.

I've found an easy way to lay radials just under the lawn - I use a short length of tank coil tubing taped to a utility knife to "inject" #25 enameled copper (available at electric motor repair shops) into the lawn. Then I went nuts and now I have 40-50 radials, which is near-perfect for 20 meters and up.

Al, thanks for reminding us that nearly every store has uninformed sales people. This problem is obviously not unique to RS. Perhaps it would help if some of the people who complain about store help would spend a week or two in retail sales, meeting the public on a daily basis. That's where you find that the problem definitely has two sides.

stevens@mpx1.lampf.lanl.gov (Stevens, Thaddeus C.) writes:

>Does anyone out there know if the call sign information for hams (
>i.e. call sign, name, address) is available electronically somewhere
>and how to access it ???

It's been a while since I posted this information for the email callbook server, so I'll go ahead and post it again. Unfortunately the data is still dated September 1989, but I hope to get it updated in a couple of weeks. Also, I have not had the time to implement the many requests for additional search criteria. It still searches by callsign only.

The database contains only U.S. callsigns, and no club stations.

73/Lee, N5LYT

The callbook server is accessed by sending mail to callbook@sat.datapoint.com. Include the following line in the body of your message:

```
     lookup <callsign> [<callsign> ...]
```

The maximum length of a lookup command line is about 200 characters. You may specify more than one lookup command if needed.

The following commands are also recognized:

```
     path - specify a return address (user@domain or bang!path!user)
     help - return this help text.
     quit - quit scanning for commands.
```

Path should not normally be needed, since the mailer should be able
to resolve your address. If you do not get a response from the server,
you might try including a path command.

Quit is not usually needed either, but may be used if you have a signature
that contains things that look like server commands.

Examples:

```
     lookup n5lyt            <= About as simple as you can be

     lookup n5lyt ns5i ka5pfm    <= Look up more than one call

     path bob@foo.com        <= A bit more complicated example
     lookup n5lyt
     quit
```

If you have any questions, send mail to callbook-help@sat.datapoint.com.

Thanks,
Lee Ziegenhals, N5LYT

Re: limiting screen current

What I've built for the screen supply is a voltage regulator with a
current limiter. The current limiter puts a sense resistor in the
supply line, then steals base drive from the pass transistor when

the sense voltage forward biases a 2N2222A.

The basic circuit is described in the ARRL Handbook section on voltage regulators. The only tricky part is finding a pass transistor that will handle 400+ volts Vce.

Re: grounded screen circuit

EIMAC makes screen bypass rings (at least for the 4CX250B genre), which look serious enough to eliminate all parasitics. The rings are clamped directly to the chassis, and the capacitors connect to the screen ring via short spring stock.

There's a VHF/UHF phenomenon called knife-edge refraction, where a mountain range will scatter RF energy. By pointing the beam at the top of the mountain, you may be able to get sufficient RF into the valley on the other side via knife edge and good ol' tropo scatter. With enough power, you can do almost anything. :)

As far as passive dipole reflectors go, it might work reasonably well. Maybe string a series of dipoles between trees on the top. It sounds like a cheap experiment, and maybe it hasn't been done before.

```

I constructed the CMOS Super Keyer II seen in the November QST. It powered up and works fine, is a simple construction project, and is easy to use.

I also have a MFJ Multi-Mode Data Controller which will operate as a keyer. I wanted something that would let me operate without having to connect my terminal to the MFJ as well as let me have a portable keyer -- the MFJ requires the terminal for control.

The keyer claims to operate at 6-60 WPM, but on the low end the dot/dash spacing is really 6 WPM which is quite intelligible to me. Despite a lot of time invested in practice, I don't yet copy code well, so like to send below 10 WPM, 8 being a nice speed for me to copy. With the MFJ unit any time the speed is below 15 WPM the characters are sent with a 15 WPM dot/dash spacing and character spacing expanded to produce the slower speed requested. I'd like to see this feature in the CMOS Super Keyer II, wish they had published the source code so I could see if that was easy to add. If they have the room left, I would guess that wouldn't be too hard to do.

This is not a problem when I'm sending by hand, but means that with the speed control set around 15 WPM my hand sending is fine, but the buffers are sent too fast. The keyer allows inserting some "gaps" between characters and this might be a possibility for me, but would not allow me to vary the speed without re-loading the buffers.
In summary though, I do like the keyer.

If anyone has discovered a way to get 15 wpm dot/dash spacing with this device while sending at a slower speed please let me know. Thanks.

Since this thread has exceeded LENGTH=infinite a little more pointless
drivel won't be appreciated any more that the rest of the replies.

Why not use 900Mhz? EVERYONE I have ever worked on 900Megs had a story
to tell about the gear that got them there. The HOMEBREW band already exists.
The least of the homebrew crew are the few that bought x-verters, and those
hams always seemed fit to tell me about some part of their station that
was fabricated by personal innovation.

As technically oriented as I am, I think this is both unnecessary and highly unwise. I really don't care what exams people pass or what licenses they hold; I care much more about how the spectrum is actually USED.

I would much rather have rules (preferably gentleman's agreements and/or spectrum management policies) that give some preference to novel and experimental USES of the spectrum. Such policies are much needed as a counterweight to the natural tendency to protect the status quo, as seen in the large number of closed repeaters that hog the VHF/UHF bands in many areas.

Unfortunately, nothing in the Fidonet document indicated that ANYONE was interested. Not even the author made any indication that he was interested in amateur radio.

So, since the Fido document doesn't show that anyone is attracted, then it does not demonstrate that any fears are unfounded. It may still be that only radical outlaw CB'ers will be attracted. The Fido post didn't say any Fido people were.

Thank you for the lesson in sales ethics. You may think this is acceptable behaviour, but I do not. I can tell you that any sales person who LIES to ME loses a sale.

>   I was making minimum wage +commission
>   and found myself caught between a Store Manager who *insisted*

The sales people are not as innocent in this as you want us to believe. I had them tell me that they got money for each name they collected ("Oh, please tell me your name"). Even if the managers had said they did not need to get the names, the sales people would still be pressing for what they don't need.

> Don't beat up a salesperson unless they REALLY deserve it....

After the first time I refuse, they deserve it. Even those who accepted a refusal often did so only after 3 or 4 tries.

If you read up on the physics of SETI, you'll see that the difference in cost (energy, complexity, you name it) between interstellar communication through the use of photons of the right wavelengths (i.e., radio) and physical interstellar travel is SO enormous that you'll realize right away that your scenario is completely ludicrous.

Equally ludicrous are the arguments that UFOs must be real because even the "mainstream" scientists think that intelligent life is likely to exist elsewhere. In short, there's an enormous technology gap between interstellar communication and travel. The technology for the first is now well within our capabilities (except, of course, that nothing we do can overcome the speed-of-light factor); the technology for the latter is not even on the horizon, and given our best understanding of physical limitations, won't be for many many centuries.

As for the earth being seen by aliens, this is of course possible once our expanding RF "shock front" reaches them (Sagan's novel "Contact" is one scenario). The usual calculations show that the human-generated signals most easily detected at interstellar distances would be the video carriers of UHF television transmitters. Fortunately, it is far harder to actually demodulate the video sidebands, so the alien interceptors will probably be spared our Ronco Veg-a-matic ads and

Home Shopping Network sales pitches.

Just thought rich hadn't made his point the first couple of times
and since his responses are such a fantastic example of an unbiased
well-thought-out covering of a relevant issue, I wanted his words to
be reiterated. If anyone has space we could make them available for
anonymous FTP, or post them on the first of the month.

Luigi@rpi.edu

Let me point out the for weak signal work and inexpensive u-wave gear
CW is the only way to go. Rarely pointed out are the groups of hams that feel
anything below 1296 is appliance country, many of them feel that those who
use USENET and INFOHAMS are below speaking to. It's too bad that once a person
gets their ticket, the chances that they hate a certain large group of
people they never met increases dramatically. Just because I have a ticket
doesn't mean I subcribe to the majority view, and I don't like anyone telling
me that their way is the way. I would say that everyone feels this way,

but then I would be speaking for others, and hams never do that.

I got a memo, published by the ARRL, from a ham radio store here in Delaware. I was thinking it might be nice if we could reprint it in our university paper to atract members to the Udel ARA. Would this be illegal?

I too am very interested in this if it exists. I have always refused to give Radio Shack my name......, and have been refused service on credit cards and checks, but never on cash. My wife refuses to go into a Radio Shack with me because it allways ends in an argument. If there is some Visa agreement of non harassment of Visa customers, I would love to complain, although Visa would probably not want to lose a client as big as Radio Shack.

In article <126@canada.sbi.com>, jerrys@canada.sbi.com (Jerry Simonowits) writes:
>
>   First, as confirmed thru my VE and mentioned in a club
> meeting last Sunday by the Norther N.J. section manager there is
> no prcedure in place for those who have previously passed elements
> 2 and 3a to file a 610 form. The VE's are only required to sign and send
> one in if an applicant has passed a unit which they administered.
>

Which VEC is this person accredited by?? Sounds like something out of the ARRL, but if he is, he is still wrong, even by their standards.

The following is extracted from The ARRL Letter, Vol. 9, No. 26 dated December 31, 1990:

```
         Assuming the code-free Technician license becomes a reality on
         February 14, amateurs who passed Element 2 and/or Element 3A
         after February 14, 1990 may now qualify for (or have partial
         ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
         credit toward) the new license. (Element credit is good only
         for 365 days from the examination date).
```

And this from the group that is probably going to take the most conservative interpretation of what the FCC says. I suggest you take a copy of the ARRL letter, which was posted to USENET a few days ago by Phil Karn, KA9Q and show it to your VE.

Let us know what transpires. Inquiring minds want to know. :-)

bill   KB3YV

PS. If the ARRL Letter is already expired at your site, I kept a
copy. I can Email it to you.

```

The following is a shar archive of a PostScript program which prints out a Smith chart. Such a chart is useful to RF engineers and other microwave weenies who still occasionally do things on paper. See the README file for details.

XDescription of smith.ps (Smith chart PostScript program)
X7 January 1991
XMarshall Jose, WA3VPZ
XJHU - Applied Physics Laboratory, Laurel, MD
X
XThe file "smith.ps" is a first-cut attempt at recreating within PostScript
Xthe chart invented by Phillip Smith of RCA which is of inestimable utility
Xto RF engineers.  The most significant object on the chart is the reflection
Xcoefficient chart in the chart's center.  This chart relates complex
Ximpedances (or admittances) to their resultant reflection coefficient.
XSee just about any introductory microwave text for further information.
X
XI reproduced the nomographs along the bottom as best as I could from the
X1966 original (Kay Electric Company #82-BSPR (9-66)), but I deleted some
Xnumerical labels to accommodate the font used; this shouldn't affect their
Xuse.
X
XAs I mention in the beginning comments, this program is for cheap
Xstudents and other not-for-profit individuals.  Anybody incorporating
Xany part of this code into a commercial product is welcome to risk
Xtheir own legal neck, but leave me OUT of it.
X
XI confess I failed in my primary aim with this chart, namely to generate
Xa combined impedance-admittance chart with different colors on a color
```

```
XPostScript printer.  Unfortunately, I was unable to get access to one,
Xso I gave up.  Nevertheless, I do have a procedure "DoGB" which will
Xgenerate the admittance circles using dashed lines and a sparser grid.
XIf it is used it should be executed prior to the execution of "DoRX"
Xso that the impedance circles are drawn on top.
X
XI have tried to be fairly straightforward with the coding so that others
Xcould modify it without much grief.  The brave souls who wouldst hack
Xthis code might find lots of places where the code could be optimized
Xfor speed; I encourage them.  There are probably way more call to "sin"
Xor "atan" than are necessary, making the whole chart take about 60 seconds
Xto print out on a LaserWriter II NTX.  Your mileage may vary.
X
XThe casual observer will notice that smith.ps does NOT adhere to
XEncapsulated PostScript Format (EPSF).  This is probably a bummer
Xif you wanted to use this in a document.  Anybody knowing how to
Xput it in EPS format, be my guest.
X
XThe procedure "Dotitles" lets you personalize the chart.  If you want to
Xmake a whole bunch of blank charts you can replace my supplied text with
Xnothings or with underlines.  The procedure "Dodots" is a half-hearted
Xtry at plotting points on the chart; it accepts an array of complex
Ximpedances and labels, and a normalizing resistance.  I gave the
XBezier fitter in PostScript a try, but it didn't work so I ripped the
Xcode out.  Any takers?
X
XAnyway, it was a interesting exercise, and I think I understand the
Xchart a whole bunch more.  Even if you're a total CAE proselyte, when
Xyou print it out and look at it, you'll still get a rush of
Xappreciation for the chart's mathematical beauty and engineering
Xutility.
X
XHave fun & 7'nerds,
XMarshall Jose   mjj@stda.jhuapl.edu  ||  WA3VPZ@N2GTE.MD.USA

I recently passed the theory exam for the General class license, but was a little too nervous for the General code. So, in the meantime, while waiting for the next testing session in my area, I am planning on studying for the Advanced class exam. First, my situation. The radio club at Northeastern University, which I am a part of, has a copy of the 2nd Edition ARRL Advanced class license manual. Now, the manual says that it should not be used to study for exams given after October 1990 because of question pool changes to the exam. My question to anyone who can help is, are the changes to the question pool so great that I would need to purchase the 3rd edition from the ARRL for the updated questions, or could those people who are part of this journal supply me with the changes made to the question pool? I do not want to sound greedy or ungreatful when asking the question in this way. I am just wondering what I shoulld do.
Please send all comments directly to sehrlich@lynx.northeastern.edu
Thank you for any help you can offer.

Someone e-mailed me and mentioned that he has found non-acidic RTV

at ACE Hardware. Others have suggested gasket compounds from your
local auto-parts store.

I have a tube of Dow Corning RTV 732 here in my hand.. but it
sure smells like vinegar. Perhaps the secret lies in the last
digit...

How can you expect anyone to accept a credit card if you refuse to give
them your name (which is printed on every card I have in my wallet)??
Are they supposed to trust you?? How do they know it isn't a stolen or
lost card?? Have you seen the book of bogus cards?? It makes the phone
book look like light reading. I am surprised most places don't ask for
some form of picture ID when using a credit card, but I certainly wouldn't
consider asking for your name to be unreasonable.

I don't know about the VISA merchants agreement. In New York State it is illegal for a merchant to require an address or a phone number for a credit card transaction. The reasoning behind this is because the credit card company already has that information and it is not necessary for the merchant to collect it. Also it is illegal for a merchant to write your credit card number on a personal check when you use one. This is to cut down on the possibility of everyone who handles your check having access to your credit card number.

Although not an internal DSP board for a PC there is a very interesting unit available from L L Grace. It looks and functions like an external modem to a PC but it contains a Motorola DSP56000 and a V40 coprocessor with 1 Meg of memory. It has programmable A/D and D/A with variable pre and post filters allowing sample rates up to 100 kHz. It also has three separate slelectable analog I/O channels and comes with algorithms built in for packet radio (300-9600 baud), CW (morse code), RTTY plus more to come in free upgrades (such as WEFAX, NAVTEX, AMTOR, SITOR, SSTV). They have an "open programming architecture" which means the user can add their own code. Base price is $595.

I have no vested interested in the company except as a potential user.
I have ordered one and will report on results when I get it going.

The classic question when I took my exam way back when was which
meter to use in measuring electrical potential. Two of the
choices were voltmeter and potentiometer.

Figuring which was correct is left as an exercise for the reader.

If your interests are in real-world digital filtering I would also recommend

Maurice Bellanger, "Digital Processing of Signals - Theory
and Practice," 2nd Edition, Wiley-Interscience, Chichester;
1989. ISBN 0-471-92101-7.

This is a translation from Bellanger's original work in French. The chapter on "Applications in Telecommunications," for example, consists of the following sections:

Advantages and limitations of digital techniques.
Frequency detection.
Multifrequency Receivers.
PCM time division multiplexing.
Adaptive differential PCM (ADPCM).
Frequency-division multiplexing.
Speech synthesizer.
Data modems.
Echo cancellation.
Television image processing.
Processing parameters in Telecommunications.

Whet your appetite sufficiently? It goes beyond the classwork stuff that is found in Rabiner, Gold, Shafer and Oppenheim (find all permutation pairs of these 4 names and you come up with the more popular books that may or not bore you to death). Actually, Rabiner has a book he coauthored with Crochiere called something like "Multirate Digital Filtering" that is also very interesting if you are intersetd in bandpass banks. Bellanger addresses that topic too but not in as such great detail.

Bellanger starts with Fourier analysis, convolutions,z-transforms and all that basic stuff too; even though it is terser than the standard course work introductions, it should be sufficient as an introduction for the mathematically mature.

Have fun!

My dad was a ham some 30 years ago (before I was eight I had already spent many hours leaning over his shoulder as he assembled various components--I grew to love the smell of soldering), and I'm interested in getting started. I know a little about electronics and I've built some audio stuff, and I'm willing to learn Morse code. I want to start simple, and I really want to build my own gear, if possible. Can anyone here point me in the "right" direction? What do I need for a first rig? Where can I get the schematics, plans, etc.?

Thanks for your suggestions--in the meantime, I'm going to build a code-practice oscillator and start learning dits and dahs...

What about a phase locked loop. With something like a MC145152, and
a prescaler you should be able to get any frequency in 2 meters with
3 to 5 ICS and a transistor or three.

The problem I see, in this electronic age, is getting the test equipment
necessary to insure you aren't jamming police calls or the like.

What would be the best set of instruments to use when homebrewing in
6 meters and up? Would one of those TV tuner derived spectrum monitors
be more than a waste of money?

Very good stuff! Permatex also has red and pink varieties, available
at auto-parts stores. I don't know if all are non-acidic. The blue
gasket-sealer is called "elephant snot" in the car-repair trade.

Non-acidic RTV is made by Dow-Corning, and I would also assume Dupont
makes it. It may be called "electrical coating," with features including
RTV rubber/silicone, and non-acidic or non-corrosive.

Non-acidic RTV is the ONLY type that should be used with any type of antenna.
Standard RTV with an acidic curing agent will corrode metallic connections.

Non-acidic RTV may be available through an electrical contractor supply
store. If all else fails write a letter to Dow-Corning and ask who
distributes non-acidic RTV.

Good luck!

I received this report (and two others I'll also post) from AMSAT a couple of weeks ago. I thought they'd be showing up in Gary Sanders' postings, but he informs me that his AMSAT feed was unreliable during the holidays and he missed them. So I'm posting them now.

The first report (included in this posting) is a summary of the SAREX operations on the STS-35 mission. The other two reports list the stations heard and worked by the SAREX packet robot. I have the feeling that many people who don't normally pay much attention to packet radio--and thus don't read r.h-r.p--attempted a SAREX contact, so I'm posting these to the main r.h-r group instead.

Patty

SB SAREX@AMSAT < W3IWI $SAREXRPT.001
SAREX ROBOT Report (part 1 of 4)
R:901222/2225z 26139@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

This report is broken into several pieces because of its length. It represents my personal analysis of the SAREX mission logs plus my personal interpretation. It is not intended as an "official" proclamation of the SAREX project which included AMSAT, the ARRL, the NASA/JSC Amateur Radio Club (W5RRR), and especially Ron Parise, WA4SIR as major partners.

Ron and the JSC group have provided me with copies of the flight logs and W3IWI has served as the repository for data received from amateurs all around the world. It is from that data that this information has been gleaned.
Tom Clark, W3IWI   December 21, 1990
----

1. Introduction
The SAREX @ AMSAT bulletins which are being distributed as a part of this series list of the 238 stations who had complete, full 2-way QSO's with the

WA4SIR packet ROBOT during the recent STS-35 SAREX shuttle mission.

To appear in this list, these stations managed to exchange two packet frames with the shuttle following the protocol defined before the STS-35 mission:

a. The user on the ground sends a connect frame to the shuttle ROBOT TNC. This contains information not previously known by the ROBOT, namely the user's call.

b. The ROBOT acknowledges (a.) by establishing a connection and sending a packet with a unique QSO serial number to the user. Mid-mission the ROBOT's RETRY parameter (which governed the number of times that this step was attempted) was decreased to 3 from 10 to provide a better balance between the time the ROBOT was transmitting and receiving.

c. The user's sends an ACK acknowledging the receipt of (b.) in response to the ROBOT.

d. On receipt of the ACK the ROBOT puts QSO into its "worked" log (providing that the station has never been worked before) and then sends a disconnect. It is not necessary for the user to receive the disconnect frame and acknowledge it.

This protocol was designed to adhere to normal accepted amateur practice: A full QSO requires unknown information to be transmitted and acknowledged in both directions.

Continued in Part 2
/EX
SB SAREX@AMSAT < W3IWI $SAREXRPT.002
SAREX ROBOT Report (part 2 of 4)
R:901222/2225z 26140@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

2. Some analysis and observations:
The 238 stations in 27 countries who completed full packet QSOs with the ROBOT can very proud of their achievement. The rough geographic distribution of QSOs (assuming that call prefixes denote location) is

60 = Mainland USA
39 = Japan
31 = South Africa/Zimbabwe
31 = Australia
26 = Caribbean/Mexico
23 = South America
12 = Hawaii
 8 = Other Asia/Oceania
 8 = Other (Israel, Canary Isl, etc.)

This list clearly shows that "DX" stations had an easier time in making a QSO than people in populated areas! I spent quite a bit of time on the phone with Ron this week discussing his observations and he made several comments that I thought was particularly informative:

a. Just as soon as a major land-mass (especially the USA) came into view, the lights on the TNC lit up like a Christmas tree!

b. The sounds coming from the speaker were a mass of noise under these conditions.

c. On scheduled voice contacts (on un-advertised, supposedly QRM-free frequencies), stations like W5RRR were full quieting but sounded unintelligible until the shuttle was overhead, just as if the station were about 5 kHz off frequency.

A few of my own observations on performance:

d. The QRM level at STS-35 had to be fierce over the USA. A quick count of the MD/DC/VA stations trying for QSOs during passes were 50-100. Assuming that we could hear only about 5% of the footprint area directly, the total number of stations bombarding the shuttle had to be over 1000!

e. The new antenna that mounted in either the Pilot or Commander's window was more directive than I had anticipated and downlink signals were often weak. This was compounded by the fact that the ASTRO mission required the shuttle to fly with the payload bay doors pointed away from the earth.

Continued in Part 3

R:901222/2225z 26141@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]
```

2. Some analysis and observations (continued):
Common experience with FM radios indicates that the capture effect will allow a station 1 or 2 dB stronger than another to "win". But if many stations are all trying, they raise the aggregate noise level and the "winner" must be 1-2 dB stronger than the TOTAL of everyone else. If 1000 equal stations are in the passband, then the "winner" must have about 30 dB of margin!

The range of distances for stations in range of STS-35 varied from 2100 km (on the horizon) to 350 km (for those directly underneath the shuttle); this 6:1 range of distances implies a 15 dB advantage for stations at latitudes below 28 degrees (the STS-35 inclination).

Ron's comment (c) shows that the combination of Doppler shift, transmitter audio deviation, and receiver bandwidth caused many signals to be off frequency. We had warned all stations to cut their transmitter's deviation below 3 kHz, but I imagine that many (including W5RRR) did not heed the warning.

Combining these thoughts, it is not surprising that "DX" stations in areas with relatively low activity and stations at low latitude had a significant advantage.

During the mission, 1711 QSO serial numbers were sent out, yielding a 238/1711 = 13.9% "hit" rate. The missing numbers result from stations who didn't meet the criteria for a full "Gold Star in the Record Book" QSO and from those who may have had more than one QSO. Those associated with the project that I have spoken to are elated with elated that it was this successful!

3. How did everyone else fare?
Since the mission many nay-sayers point not to the 13.9% (one in seven) success rate but instead bemoan the six-of-seven as a failure.

Many other stations managed to be heard by the ROBOT and saw their QSO number being sent (step (b.) in item 1), but failed to have their ACK heard (step (c.) by the ROBOT. Although they didn't qualify for a "Gold Star", it had always been our intent to have a "Silver Star" award for them too.

Continued in Part 4
/EX
SB SAREX@AMSAT < W3IWI $SAREXRPT.004
SAREX ROBOT Report (part 4 of 4)
R:901222/2225z 26142@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

3. How did everyone else fare (continued)?
The configuration of the ROBOT TNC only permitted us to permanently save the "Gold Star" QSO's on board. The list of stations that were heard, but which did not meet the full "Gold Star" criteria were transmitted to the ground in the "QRZ" beacon which looked like

```
     07-Dec-90  11:57:17  WA4SIR*>QRZ <UI>:
     #1088-AH6GR AH6IX JA9IHI JJ6AGK JH2NIT JJ6AGN JR5EBL JJ6AGM .....
```

Each of these beacons had a serial number (#1088 in this case) followed calls of the 35 most recently heard stations; since this list was maintained separately from the "Gold Star" worked list, it also included the calls of the successful stations.

In all of the pre-launch publicity we told people that we needed to have this information submitted so that everyone else could also receive their "Silver Star" award and that any QRZ beacons logged (including a UTC time stamp) should be sent in to let us to develop the complete logs.

So far the QRZ beacons submitted (including some which Ron captured in real time during the mission) only fill about half the time during the mission. Many people will be disappointed in not receiving their "Silver Star" QSL card unless we receive some more data! Send any QRZ beacons you may have captured as a packet message addressed to

SAREX@W3IWI.MD.USA

or by SMTP Internet mail to

       sarex@tomcat.gsfc.nasa.gov

The next 5 messages in this series list the lucky 238 "Gold Star" QSOs.
Congratulations to all of the successful stations.

73 de Tom, W3IWI

KA1WNU asks if he can study from a slighly expired manual.

Depends on what he wants.

If he plans to memorize every question possible and get by
as many do strictly by memory without knowing or learning
much of anything, by all means be sure to have a most up to date
book.

The basic theory hasn't changed much over the years. Thus if
a testee knows the basic part 97 regs and the generalized
theory any manual will give the general outline of the test,
regardless of the element.

When I took the tests (G, X; there was no advanced back then)
the question pool was not public; I studied no
questions as such, but just knew the generalized theory and
from reading part 97 knew the rules; had no problem passing.

The code was a different story --- it gave me *trouble*.
]
In spite of that I now stick mostly to CW. By choice.

```

Without further adieu, here is the complete list of the 238 "Gold Star"
QSOs. In this table, the Date/Time are in UTC as maintained by the clock
in the ROBOT TNC and the Grid Laptop carried on the shuttle. The MET column
is Mission Elapsed Time in Hours.

[Please see my "SAREX Report" posting for a general introduction to these three postings. Also please note that this "heard" list includes ground stations that successfully made two-way contacts with the SAREX robot as well as ones heard but not worked.]

SB SAREX@AMSAT < W3IWI $SAREXRPT.010
Summary of stations heard (Part 1)
R:901223/0537z 26236@W3IWI.MD.USA.NOAM [Balto/Wash MD/DC]

The following is the sorted list of 570 unique calls logged during the WA4SIR STS-35 SAREX Packet operation for which we have received information. It includes the calls of the 238 stations that were logged as full, complete QSOs plus all reports received as of 22 December.

The calls in this list are preceeded by a symbol which denotes the source of the data according to the following key:

* = One of the 238 full 2-way QSO's during the operation

+ = Station was heard and log info was captured by Ron onboard the STS-35 during one of the periodic data dumps to the Grid laptop computer

. = Station was heard and log info was submitted as a QRZ beacon by a ground station.

? = Station's call appears submitted data but the date or time or beacon serial number were bogey and additional data is needed.

If you think you were heard by the shuttle and your call does not appear in this list, the reason os that nobody has submitted a QRZ beacon with your call in it! The QRZ beacon that was transmitted during the flight looked something like this:

```
   07-Dec-90  11:57:17  WA4SIR*>QRZ <UI>:
```

```
   #1088-AH6GR AH6IX JA9IHI JJ6AGK JH2NIT JJ6AGN JR5EBL JJ6AGM ....
```

If you captured any of these QRZ beacons and have not submitted them, please do so ASAP since YOUR contributions are needed to complete the SAREX logs. Be sure to include a UTC time stamp and send them as packet messages addressed to

    SAREX@W3IWI.MD.USA

or as SMTP mail on the internet to

    sarex@tomcat.gsfc.nasa.gov

This question is rather silly.

Can't you understaind plain english?

A Voltmeter measures Volts.

A Potentiometer measures potentios.

See any hamfest for bargains on potentios.

See me when you ;find a use for them.

I'll trade for a batch of gonios which I
can't make sense of due to lack of a

operative

Goniometer.

The main motive for homebrewing a 2-meter rig would be self-training,
not saving money. It would have to be inexpensive, however, because
people wouldn't want to spend $250 on a self-training project when

they could have a full synthesized HT for that price.

Presumably, the idea is that they SAID the item was for sale for a particular
price;
if it isn't, they were guilty of misrepresentation.

Also, the concept of "legal tender" means that a merchant
has to accept cash; can't hold out for some other kind of payment.

> I have been using a J38 Key for many years. A few months ago I got a new Kenwood TS-950SD, which has a built in Electronic Keyer. Can anyone suggest keyer paddles, advantages of each vendor, etc.

What? You're still using CW?!!?!? :) Just kidding. I use it all the time.

For a number of years I used the Nye/Viking paddle because it was CHEAP. Recently I started using a Bencher, which is generally regarded as the best iambic paddle around. I love it. The action is incredibly good.

Another one you might look at is the Vibroplex Brass Racer type, which I think is a little cheaper than the Bencher. But be careful...Vibroplex makes some that are NOT iambic, but are the old sideswiper type. It is probably a matter of personal taste, but I think the iambic squeeze type key is much better.

1. Congratulations on wanting to start out the right way.

2. Lots of construction articles in QST;

The stuff by Doug DeMaw, W1FB is excellent: easily put together, workable, and useful. I'd class Doug as the top tomcat of beginner homebrew. Many other mags have h/b articles. The old Ham Radios (now defunct) are excellent but on a higher plane. Stuff in CQ and 73 can be good, but QST is generally more reliable and with the DeMaw stuff alone there iis more than enough to chose from.

3. To start out by buying a new high-price ricebox is

to me the Wrong Way though it's today's standard.

Good luck.

K3TX

> Here's a (perhaps remote) example of what I mean: My XYL's car has an automatic deck lid closure that is motor-driven. It failed due to breakage of a CHEAP! plastic gear. Dealers told me that this gear was impossible to get, and that it would require replacing the entire assembly ($200). Yet the part was easily accessible, and easy to remove and replace! To make a long story short, I finally obtained the part through the auto manufacturer, and spent about 20 minutes (including R & R of the assembly) to fix the thing.
> (P.S. If yours is broken, I'll fix it for $100, you ship)
>
> The point is, that we seem spring-loaded to the "throw-it-away-and-buy-a-whole-new-one" position. Or, we technically-inclined folk dash it off to the nearest fix-it guy rather than doing it ourselves (and thereby probably getting a poor job than we could do).

This reminds me....I have heard that if some minor part on the motherboard of your average clone computer fails (say a DIODE, which costs about 9 cents) that NO ONE who you take your PC to for repair will ever replace the diode. They always charge you for a NEW MOTHERBOARD, since a failure on the motherboard is regarded as too complex, and they never attempt component level troubleshooting on these things anyway.

Is this true?

It seems logical that if someone shows up with valid certificates for elements 2 and 3a we (our VE group) can complete a 610, attach copies of the certificate, and validate the 610. No big deal.

We will also suggest he give a shot at 5 wpm at least so he can upgrade to Novice. Optional, of course.

Really, which is the higher class license now: N or T? I dunno.

Also really don't care.

Yes I agree that there are HW 101's around at reasonable price.
Apparently someone had a rather beat-up 101, as it's hard to
justify the term UPGRADE for the transition from 101 to TS430.

Fortunately I've not had too much experience with the TS430
(my kenwood usage has mainly been with 440, 930, 940) but
our club got stuck with one which I've played with quite a
bit. Granted there are worse transceivers floating around,
but the best usage for a TS430 seems to be to keep Yugos with
defective brakes from rolling downhill.

Everyoone seems to go apeshit over the pushbuttons, memories,
other bells/whistles of the riceboxes without considering
whether they receive and transmit worth a damn.

Buy American: It Pays and you may get Good Stuff.

My personal opinion is one guy in one store screwed up. I do know that RS has been very strict in their instructions to their employees about selling ham gear to unlicensed people, so it may be that whenever ham radio is mentioned some individuals get hyper-cautious.

Correction: The ARRL logo(s) should not be used for *commercial* use
without permission. You can use it on club newsletters, QSLs etc
without explicit permission. And ARRL membership is not required.

Hmm.. I didn't think of this earlier.. Please excuse the possible creative
misinterpretation that follows...

Scenario: I pass elements 2+3A in Thomasville GA in mid-February (soonest
nearby testing) and fail my 1A (I'm going to try for it even though my
comprehension isn't good enough yet @ 5wpm) and apply for my 30MHz+ Tech.
In March (next local testing date) I pass 1A in front of two Generals. Can
I then apply for a Novice, thereby gaining HF privs? Or reapply for a full
Tech? (with new call letters, maybe?)

I'm only wondering. I assume it's a bit more difficult to find three VE's
than it is to get two Generals. (Q: are the three VE's required because
of the CSCE?)

This should probably have been posted to rec.ham-radio.policy :-) :-)

Could someone please supply the path to mcimail. I'm not able to
find the gateway system.

I am the QSL manager for the 8E callsigns. I have about 100 cards for
WB8ECC, and they are still coming in. He has never sent in any envelopes,
but I would like to ask him to do so. But he has not been listed in
recent callbooks.
Is he a pirate?
Is his license expired and he doesn't know it?
Are the FCC files fouled up?
Other possibilities?
How can I find out if this call was ever issued, and to whom?
From looking at the comments on the cards, I know his name is Jim,
and he lives in St Mary's, W Va. He works 15 and 20 ssb and cw, and
apparently ragchews, based on some of the lengthy notes written on the
cards.
Any help in finding this guy would be most appreciated.

Bob Dixon

If I have misunderstood you please accept my apologies and I'll look for you
on the bands. However, let me reply to your next statement.

> What I meant by "fast CW snobbery" was the attitude -- very widely
> expressed in the no-code debate -- that "I can receive 20 wpm and that
> makes me a superior person and knowing how a radio works has nothing
> to do with it!!!" And there *are* plenty of people with that attitude,
> who think they "earn" ham privileges merely through fast code speed.
> You do not appear to be one of them, but they do exist.

I honestly have never, in several years of reading this group read a posting that expressed overt "fast CW snobbery". I read fast and I read everything in this group and I have just not seen that attitude here. Now I'm not impuning your integrity, maybe we are just reading different things into the same postings. Since you do work CW I know you will attest to the fact that the people you meet on CW are overwhelmingly supportive of anyone they find on the bands regardless of their code speed. Most CW OPs are quietly fearful that CW IS dying and any signal heard on the CW bands is precious and anyone who is going through the pain of operating at less than 20 WPM is a hero to be praised for his effort and cultivated with great care and patience. No one who loves working CW would ever intentionally alienate a slower speed operator by a rude, snobby attitude. Thats one reason I work CW. As a Novice class OP every time I got on the air I was covered by Extra class signals like flies on a cheap suit. They made me feel like a valued member of the Amateur Radio Service as I stumbled along, slow and sloppy. But I kept coming back because the people I met made me feel good about the effort I was putting in and I trusted them when they said if I persisted I would break through to a level of operating ease that would make CW a pure joy. They were right and now I feel an obligation to pass on the kindness that was shown to me.

If you are running into "fast CW snobs" I would venture to say they are probably people who just passed the test and threw away their key. They wouldn't last long on the CW bands. Anyone who deliberately treats slow speed OPs rudely will find it hard to scare up a QSO after a while. If I meet them in person, they might find it hard to hold their mike with broken fingers.

And I SUPPORT the new FCC ruling on the no-code licence above 30 Mhz. I say welcome to all the new hams it will bring in and forgive me if I keep trying to stuff a key in your hand when your not looking. B-)

The first stop is always the ARRL Handbook. Next are the four design
"notebooks" by W1FB Doug DeMaw. After that you should be prepared to
tackle the more dubious projects in the ham magazines and start designing
your own projects. Check your local ham store or the ARRL for these
materials.

I recently spent a half-day in a hospital emergency room and saw they had an inverted 17" antenna hanging from the ceiling which appeared to have a co-ax running to the outside of the hospital hooked to another similar antenna. I did not trace the coax to see if there were any modules of any sort along the way but it was my thought that this was to help RF get in/out of the ER when paramedics come in with their HTs... any comments from anyone who knows for sure are welcome???

Seems to me that the proposed arrangement ought to be legal. To carry the situation to a ludicrous extreme, consider the undriven elements on a yagi. They influence, and are influenced by, the radiation from the rest of the antenna assembly. It could be argued that your two antennas connected by a length of coax are nothing more than part of your overall antenna system.

Lines: 20

The group Emergency Services Officer for this Civil Air Patrol group had made a suggestion/request dealing with the use of CW by ground teams who are in mountainous areas not well served by VHF FM.

Basically, is there commercially available a crystal-controlled, portable CW transceiver that will operate on 4, 7 and 12 MHz? It needs to be light and small enough to be a minimal load to a person in mountainous terrain. It should use easily available batteries. I think there is a military device like this, used by Special Forces teams. Is this available through surplus channels, and does anyone know what the mil designator is?

I would like to stay away from homebrew, but that may turn out to be the only option.

To preclude the legal questioning: these units need not be type certified as they will be certified by a commercial licensee for use by legally licensed CAP members. There will be a waiver to allow CW use prior to them being used.

Last time I looked at U.S. currency (printed), on the face side, there
was a statement "THIS NOTE IS LEGAL TENDER FOR ALL DEBTS, PUBLIC AND PRIVATE"
which, when confronted with RS hassle, was pointed out to them, they acquiesed
to it (admittedly, with the asking of use of phone to call the treasury dept.,
and police, since it is a law...

I suppose they could have exercized their right to refuse my business...

Funny how the employees take the "try to get their name and address" to mean
something different... poor communications result in an amazing number of
screw-ups like this.

I built the 2 meter receiver that is ne602 based. It works but the squelch doesn't (though I made work after looking at the spec in the motorola book) and it really needs a preamp. Though for ~$20 what do you expect. Other than that the parts/board/instructions are pretty good. I was considering building there 2 meter amplifier but I might do it with a module, which I hear are easy to use and may have better performance.

Oops. Right! (Damn "scientific" mode on the old - and I do mean old - 19C).
Well, anyway, the 0.2 uF value suggested would just work that much better -
if you can find one that's still a cap at that frequency. :-)

This kind of thing is supposedly really done to provide TV/radio to
valleys otherwise shielded. Sometimes refered to as a "Passive
Repeater" or a "Beam bender".

I heard this from a broadcast TV engineer who was looking into the ham
applications of it.

From <jim.grubs@w8grt.fidonet.org (Jim Grubs)> I read:

Subject: Others' view of codefree

>The following is part of the text of an article that appearred this week in
>FidoNews <tm>, the weekly newsletter of the amateur computer network called
>Fidonet <tm>. I am reproducing it here to demonstrate that the fears that only
>radical outlaw CB'ers will be attracted by the codefree license are unfounded.

(selected passages of FIDONET IN 1991 text deleted)

I read the entire thing twice, and I found nothing whatever to suggest that "fears that only outlaw CB'ers will be attracted by the codefree license are unfounded".

What I did infer was that there are a lot of technically-inclined computer hobbyists who don't seem to be interested in Amateur Radio.

Also, here is an interesting comment that seems to bear out my previously-voiced contention that many computer enthusiasts have found Amateur Radio to be just another peripheral, a substitute for land-line connections so to speak, and thereby avoid long-distance phone charges.

> 2) There are no long distance charges in amateur radio. Thus, it may have great appeal to those in rural areas. Those using amateur radio for data transmission need not be quite so concerned with shaving every last byte off of a transmission in order to save phone charges (I'm not saying that efficient protocols should not be used, but it's simply not going to be quite as big a concern). The fact that phone charges are not an issue may mean that there are fundamental differences in the way traffic is moved via amateur radio.

and the article goes on to point out that *radio* hobbyists seem only to want to talk about their hobby:

> 4) Again, I must point out that I'm not an amateur, but it seems that one of the problems with amateur radio is that many hams seem to want to talk only about amateur radio, and nothing else! We have those types in Fidonet, too, of course - the folks that participate only in the computer- and communications-oriented conferences. But in Fidonet, there are conferences on a fairly wide range of other subjects as well. I'm not sure if amateur radio has this diversity now, but if it doesn't it probably will.

Radio hobbyists will probably still talk mostly about *radio*. Computer hobbyists using Amateur Radio as a connecting medium will probably continue to discuss their own areas of major interest.

>   But now that the psychological barrier of the code has been removed,
>   (some deleted for effect)
>   This cross-pollination of the two technologies could ultimately
>   affect us in ways we don't yet realize.

This profound statement may still be ringing in our ears years from now. IMHO, there is going to have to be some compromise on both sides for it to occur. Both the OF's and the NF's need to realize that this is the joining of two hobbies: computers and radio; and each *should* be willing to become knowledgeable (at least marginally) in the other "technology". Which means that each should be willing to abide by the other's rules without all this finger-pointing and name-calling.

This is going to be important in order for Amateur Radio *not* to become CB-ized (not the same as Jim's allusion to fears of outlaw CB'ers coming into the hobby); and for Amateur Radio not to cease to exist as a hobby medium for *radio* hobbyists.

>
>Is this true?

In many cases, yes. I would bet that the average computer repair shop (not just a clone shop, this goes for the major brands such as IBM, Apple, etc.) will not go into any more detail than, say, replacing a motherboard.

What usually happens to a machine with a problem is this: The machine is brought in for service. Then the cause of the problem is localized to a few major components, i.e. disk drive, motherboard, power supply, etc. Then the troubled component is replaced with a good one. The troubled component is then usually sent back to the manufacturer for rebuilding.

On some components, i.e. the motherboard, it takes less time (and money, at the rates most service people charge) to just replace the component, since it might take a while to find the problem on, say, a bad motherboard.

I have to agree with some of the discussion going on regarding homebrewing equipment. You *will* learn a lot about making RF circuits work that a book just can't give you. HF CW QRP transmitters can be thrown together for just about nothing, scrounging from old TV's (a pair of video driver transistors in push-pull will give 4-6W out, dependingon device type, etc.) All in all, more of the amateur population in the US should be heating up their soldering irons and taking a crack at making something for themselves.

The part of the discussion that I find puzzling is the so-called 'Anti-Code Agenda'. I just don't see the validity of the argument that the other digital modes are going to force CW from the HF spectrum forever. They used to say that SSB would eliminate AM phone from the HF amateur spectrum too. Sorry, folks. The AM'ers are still with us (albeit not in the great numbers of old).

I have *NEVER* seen it proposed that CW be eliminated as a legal mode of emission. As long as it is legal, and people want to utilize the mode, it'll never die out. The thing that *will* become difficult will be locating the quiet slots in the bands for QRP QSO's in general. I don't even think it's possible to have a QRP SSB QSO in the 20m phone band during prime time in the US.

I think the idea of a homebrew (or QRP) reserve or subband is a good one, but the entryway to the reserve should be based on TECHNICAL KNOWLEDGE rather than CW ability. Now I've been hacking little CW transmitters ever since I got licensed (1977), but I never did manage to pass 1B or 1C, even though I have, on occasion, been able to have a QSO at 20-25 WPM, solid copy in my head. I like CW, but the tests leave me cold. This is the whole point of the debate: Those that want to operate CW will seek their own proficiency level, regardless of what speed the license they hold implies they can do. 5 wpm is the basic proficency point. Those who want to become more proficient will do so. If you like CW, you will want to improve your ability, and if you never use it again you will still probably be able to copy 5 wpm.

I would dare say that if you took the whole body of General, Advanced, and Extra class licensees, sat them down in a room right now, and administered the requied element 1B or 1C, the majority (> 75% IMHO) would fail!!! (even more if it was the way it used to be where you had to have one minute SOLID COPY on paper)

Come on folks! We should be handing out spectrum privleged based on the level of technical knowlege rather than how fast one can translate Morse characters and transcribe them to a piece of paper. The ITU requires 5wpm for anything below 30 MHz., and I think that requirement should remain. However any requrement above 5 wpm is irrelevent. I'll have to look up the exact rule, but in the mid 1920's all you needed was 5 wpm for full HF access (never mind that there was only one class of amateur license).

The ARRL Handbook is an excellent HANDBOOK, but I would recommend the ARRL
study guides for getting your license. The Novice book (Tune in the World with
Ham Radio) is $19 including code cassette tape. The Technician, General,
and Advanced books are $6 each, and the Extra guide is $8.

I agree the ARRL Antenna Book is excellent, one of their best pub's.

>of the CSCE?)

First, you cannot "reapply for a full Tech (with new call letters, maybe?)" because such will not is issued after 2/14/91.

Such *will* exist if the ticket is dated on or before 2/13/91, but after that, the Tech license issued by the FCC is a codeless Tech license. One can *get* the equivalent of "full Tech" privileges by having a CSEC for 1(A), the 5 wpm test, but the FCC Tech license issued after 2/13/91 will have no way to indicate possession of that CSCE.

(Admittedly, the FCC has asked VECs to provide them with lists of codeless Techs who earn the 1(A) CSEC, but, as indicated below, the FCC has not figured out how to handle that data.)

Now, here is the wonderful new topic to beat to death.*

You ask if you can pass 1(A) "in front of two Generals" and thus earn HF privileges for a codeless Tech license.

I believe the answer is no, and for the simple reason that only VEs can issue a CSEC.

In its order, the FCC is very clear that you must have a CSEC; it could have but did *not* say that one simply had to pass 1(A). The order says you must have a CSEC; that is the key.

Why?

James Georgias (W9JUG), head of the DeVry VEC (the fourth largest VEC), has stated that since the FCC stated that a codeless Tech must have a 1(A) CSEC to obtain HF privileges, and since CSECs can only be obtained from a VE organization, this means that the codeless Tech *must* take 1(A) from a VE -- not from two Generals. Fred Maia (W5YI), head of the second largest VEC made a similar statement.

Georgias further has stated that this may be a first step by the FCC to bring the licensing of Novices under the VECs. He states this is desirable in light of documented fraud in the issuance of Novice exams. (No, he didn't give examples.)

Rec.ham-radio net great, Phil Karn, KA9Q, who clearly has more fingers and toes than I do, actually typed the whole FCC Report and Order into his computer and submitted it to rec.ham-radio. It makes fascinating reading. Excepted below are the points relating to 1(A). You might wish to read the rest also.

****

From FCC PR Docket No. 90-55 released December 27, 1990

31. Discussion. The comments of NCVEC and ARRL, in effect, recommend that the documentation showing that a codeless licensee has later passed a telegraphy examination be accomplished by the Commission issuing a sixth class of operator license. The sole purpose of this sixth class would be to distinguish those codeless Technician Class licensees who subsequently pass the five words per minute telegraphy examination from those who have not. In paragraphs 21 and 22, we discussed why the addition of a sixth class of license is impractical.

32. We do not agree that use of the CSCE to indefinitely document the passing of a telegraphy examination would have any significant negative effects in this instance. The VEs and VECs already perform the necessary work. The VEs now issue a CSCE to each successful examinee. The VECs receive from the VEs the application forms and test results for every examination session. The VECs are required to make their examination records available to the Commission. [51]

33. We do not foresee, moreover, that there will be any increase in enforcement difficulty resulting from using the CSCE to document the passing of a telegraphy examination for an indefinite period. Our rules already authorize a licensee holding a CSCE to exercise the rights and privileges of the higher operator class for a period of up to 365 days. [52] This provision has not resulted in any increased enforcement burden. Section 97.301(e) is amended, therefore, to implement our proposal to use the CSCE to document indefinitely the passing of a telegraphy examination for the purpose of authorizing to codeless Technician Class licensees privileges below 30 MHz. We will confer with the VECs to establish a schedule for reporting the call signs and names of "Technician Plus CSCE Class" operators. [53]

You hit it EXACTLY on some points but missed on some others. The "fast
CW snobs" are not snobs on CW. On CW I have met nothing but courteous
operators. But then, they had to slow down for me to begin with......

But, the '*' operators who I think you mean to classify as 'snobs' are the
the kind of guys who are extras, who bitch at you cause you AREN'T a
fast CW operator, but do their bitching on phone! If they want to give
up CW after they get the extra ticket, fine. I know one extra who makes
SURE everyone knows it, and he IS sharp technically, at least for HF,
and he readily admits that he couldn't
keep up with some others who are trying for General.

The people who ARE on CW I think are scared, but they are still
courteous on CW. I really do think the snobs as you called them are the
people who are NOT CW operators, just people who passed the CW test.

If you don't enjoy it, you don't enjoy it. Admit it.

Mike Yetsko
N1DVJ

Perhaps the fortune our vax gave me seems appropriate to those who want
people to think they enjoy CW, but dropped it.

"Beware of the man who works hard to learn something, learns it, and finds
himself no wiser than before", Bokonon tells us. "He is full of murderous

resentment of people who are ignorant without having come by their
ignorance the hard way."

No, receive is optimized for 200 Hz shift. It still outperforms most that
I have tested it against, but that is for another day. The problem is
that it uses 200 Hz shift on TRANSMIT.

Jay, Doug:

I am writing the `DSP Experimenter's Handbook.'  It will be one of those books that `has a floppy or six' in the back full of all my design tools for Motorola DSP56001, TI TMS320C25 for filter design, modem design, how to do a spectrum analyzer in DSP, in your PC, etc. etc. It will take a year to produce. I hope you can stand to wait that long. This will not be a course in theory though theory will be presented. It will be divided into sections on theory and sections on `Cookbook' in much the same way that the Satellite Experimenter's Handbook by Marty Davidoff, K2UBC handles the two facets. It is my that by the time you are done with hacking away at it, you can design a fairly arbitrary synchronous or asynchronous FSK or BPSK modem. Practical clock recovery will be covered in detail. This will be a practicing DSP writers book but every application discussed in it will have an amateur radio, amateur or weather satellite application. You will be given a preview of how the book will look in my upcoming "Here is a thing to DO with DSP and How I did it" article for QST on WX satellites.

I am certain that the League will publish it but they have not committed yet. I am certain they are waiting to see `how I do' in producing the chapters.

> DE: Kok Chen

Kok, that is a great idea, that is the reason it is called the Kenwood TS-950DS!   It does `perfect' sideband generation. I believe the TS-850SD has two DSP chips in its DSP unit, one for receive IF as well as Xmit IF.

On the other hand, IMHO, Hilbert transforms are absolutely trivial in DSP. Here is a simple approximation to a Hilbert transform:

take three consecutive samples x0,x1,x2

x2-x0 is the filter

This will do a hilbert transform quite well in mid band. To have one that works over an extended band, one breaks out the old Park's McClellan algorithm, punches up Hilbert transform, picks the bands you want to transform and tell it to go. You do a spectrum of the response to see if you asked for too much and if so you make the filter longer or if that is undesirable you relax your request. In every modem I have written for the DSP thingy's I am working on, where there is a PLL, it is a beautiful thing to see the improvment in the performance gained by using the Hilbert transformer and doing a `perfect' SSB demod. There are NO mixing sum products coming out of the phase detectors that then require severe filtering (and adding a big group delay between the VCO input and the phase detector). The longest one I have is 49 taps in a PLL version of the HF modems that are standard in the multimode controllers (but optimized for the right shifts ;-). I also do filter based discriminators so that you can compare the performance. You will all be surprised. I believe in this case, unless you elaborate on your statement (which after all you said was opinion), I disagree with you conclusions concerning Hilbert transforms.

There is no mention in the rule changes that the test must take place
on or after Feb 14 1991.  What the rules DO SAY is that the privileges
are in effect for licenses ISSUED on or after Feb 14 1991.

The ARRL does not make rules.

I suggest you look at the rule change itself (excerpted from the copy
of the report and order typed in by Phil Karn, KA9Q):

> 24. We are, accordingly, establishing the Technician Class as the
> codeless class of license that includes all amateur privileges above 30

> telegraphy examination. [37]  This satisfies our objectives of
> establishing a type of codeless class of license that can be
> implemented promptly and avoiding negative effects upon the work of the
> VEs or upon our workload and resources.

The rules simply do NOT state one way or the other whether or not the
tests must be actually passed on or after February 14, 1991.

Jean-Louis:

Sorry, I cannot give you an easy answer. You could indeed proceed the bandpass filter in the AEA unit by yet another bandpass filter that is slightly tighter however. You would almost surely have to follow this with an all pass filter to right the wrong you did by introducing additional phase group delay but I have NOT made calculations to prove this. It seems clear that to make the Q of the filter much high (narrower) would almost require you to place a several pole filter out front. An ALL PASS filter can be used to do some equalization but the design of this would require many hours of analysis that I cannot do. Possibly you can do this?

>   theory (program wise that is).

The only ones that I am aware of that are remotely close to being real are

The AEA unit has the first 100 rolled onto the assembly line this week and will be shipping soon and the TAPR / AMSAT TMS320C25 board. Alas, notice I said board. It is indeed a plug in board. As late as two weeks ago, I heard LL Grace on the air trying to get the AX.25 handler working in the DSP-12. There were broken AX.25 (but well formed HDLC since the chip does that for you for free) packets. I cannot therefore include it in the list of things I believe are close to reality. Three weeks ago, the unit had not been FCC certified but I do not know the current status. Caveat Emptor.

The exact status of the AEA box is that 5 will be done, fired up and tested, and if this went well the other 95 will roll off the assembly line. The TAPR/AMSAT DSP card is in its second incarnation (second round of copper) and it should be ready for shipping within the next 6 months, given no major headaches between now and then. Do not ask me for availability dates/prices. I do not know. Call AEA and/or TAPR for the answer.

> - You mention good results using discone antennas. I am curious. I have an ICOM R7000 and a discone, the local satellite shop told me NO WAY, I think they are just trying to sell me their equipment. What is your opinion concerning whether or not I can get satellites with my equipment.
>

What do you mean? I was specifically referring to birds in the amateur satellite service. If you mean television satellite and using an R7000 and a discone as a TVRO setup, your local shop is right. There is no free launch here ;-).

> ps: will you be at Dayton?

It's my pleasure. I do it for the kick and I really do enjoy the technical tinkering around. Enjoy, is not a strong enough word, I can't live without it ;-).

I am always at Dayton, missed only once in the last 15 years, and last year was the absolute pits in that I didn't get to go to the packet dinner at McNasty's. Since there is little hope that I will be Ham of the Year ;-), I suspect that I will be at McNasty's this year.

I am also giving talks in the Digital Forum (primarily but not limited to RTTY, AMTOR, Baudot), the Packet Forum, and the AMSAT forum as well. AMSAT has adopted officially a new satellite project and so far, Dick Jansson, WD4FAB and I have been doing most of the technical work on this side of the pond. I need to report on that project's work and show some working computers, transmitters and the like.

I hope to see you there.

Bob

Some comments on the Butternut vertical vs. the R5:

I have a Butternut vertical with a WARC kit. The vertical works
fine on 30, 20, 15, and 10. It works pretty well on 40 meters
since it is nearly a quarter wave there, altho it doesn't cover
the whole band (if yours does, it has high ground losses).
It is quite dependent on ground radials.
You MUST have two TUNED radials per BAND.
Random length radials detune the antenna, if they work at all.

HOWEVER, the 12 and 17 meter WARC kits work very poorly. They
are very hard to tune (lower antenna, move tap 1/4 inch, retry),
and barely cover the 50 kHz. band.

Remember that the R5 is only about 20 feet long. It is really
only a little over a quarter wave on 20 meters. Tuning it to
an "electrical half wave" exacts a high penalty in terms of
efficiency and/or bandwidth. The radiation resistance of a
quarter wave dipole is only a few ohms (measured at the center).
This isn't obvious due to the end feeding. You would be a lot
better off with the Butternut, if you could handle the radials.

Or do what I did, and put up a full size half wave 20 meter vertical
(33 feet high). Then you have the best of both worlds.   Covers
the whole band without retuning too.

Rick N6RK

I wouldn't bet cold green cash on it. You would not believe how hard
I worked to significantly outperform the PK-232 in DSP. Put them side
by side and do an on the air BER test.

Dan:

The quick answer is yes.   AEA is rolling the first of their units
off the assembly lines, LL Grace is advertising something in QST,
and TAPR/AMSAT have gotten their prototypes plug in card up and running
like a champ.

More details are available in other replies.

Bob

pbhx@ellis.uchicago.edu (Peter B. Hayward) writes:

>First, you cannot "reapply for a full Tech (with new call letters, maybe?)" because such will not is issued after 2/14/91.

>Such *will* exist if the ticket is dated on or before 2/13/91, but after that, the Tech license issued by the FCC is a codeless Tech license. One can *get* the equivalent of "full Tech" privileges by having a CSEC for 1(A), the 5 wpm test, but the FCC Tech license issued after 2/13/91 will have no way to indicate possession of that CSCE.

What about those who lost their "pre 91.02.14 Tech" license and get a replacement from the FCC, which will have an issue date AFTER Feb 14 1991?

>(Admittedly, the FCC has asked VECs to provide them with lists of codeless Techs who earn the 1(A) CSEC, but, as indicated below, the FCC has not figured out how to handle that data.)

They must not have read ALL of my comments in 90-55 (though they did read at least paragraph 3 as they mentioned in the Report and Order). My comments, in paragraph 6, informed the FCC of the difficulty in processing licenses with an indefinite CSCE system.

>***Now, here is the wonderful new topic to beat to death.****

>You ask if you can pass 1(A) "in front of two Generals" and thus earn HF privileges for a codeless Tech license.

>I believe the answer is no, and for the simple reason that only VEs can issue a CSEC.

Technically speaking, you can TAKE it, and you might even PASS it, but Peter is correct, you won't have the all-important CSCE.

>In its order, the FCC is very clear that you must have a CSEC; it could have but did *not* say that one simply had to pass 1(A). The order says you must have a CSEC; that is the key.

But not everyone will have the CSCE:

1. Novices who upgrade to Tech after Feb 14 1991 will NOT have a CSCE although the VE administering the elements 2 and/or 3A could write one up.

2. Those who have to get a replacement license for a lost one.

>33. We do not foresee, moreover, that there will be any increase in enforcement difficulty resulting from using the CSCE to document the

>passing of a telegraphy examination for an indefinite period. Our
>rules already authorize a licensee holding a CSCE to exercise the
>rights and privileges of the higher operator class for a period of up to
>365 days. [52] This provision has not resulted in any increased
>enforcement burden. Section 97.301(e) is amended, therefore, to
>implement our proposal to use the CSCE to document indefinitely the
>passing of a telegraphy examination for the purpose of authorizing to
>codeless Technician Class licensees privileges below 30 MHz. We will
>confer with the VECs to establish a schedule for reporting the call
>signs and names of "Technician Plus CSCE Class" operators. [53]

Again, this does NOT cover all the possible ways one would be a "Tech
with HF". There are THREE such ways:

1. New Tech passing 1(A).

2. Novice upgrading to Tech.

3. Tech before Feb 14, 1991.

The CSCE scheme only addresses ONE of these ways.

By casually looking at the HRO spec sheet, the FT-757 appears to have more
features than the IC-735.  I must be missing something that the spec sheet
doesn't divulge.

I'm looking for an exceptional receiver, including passband tuning (some
call it IF Shift),and a built-in CW keyer.  The 757 has this, but the
735 does not.  Is the 735 better because it has a better receiver, which
is a highly-weighted criterion ?

   Nothing in that document showed that anyone (including the author)
was attracted to ham radio. Or, in terms you want, nothing said that
anyone had their curiosity aroused.

   Your definition is rather poor. My curiosity is aroused as to why you
think a recap of the new license posted in Fido means that Fido people
are attracted, but I certainly am not attracted by it.

This same sort of thing also applies to establishments that refuse currency
denominations greater than $20, I believe. The wording on all currency
states that it is "legal tender for all debts, public and private".

I bought one of those kits to make a converter to turn your AM radio into
a ShortWave receiver. The kit was nice, the directions were fine (I had
some problems with part identification but even a software weenie can learn
something new). I used my Sony 2010 to 'tune' the oscillator circuit to
about 9 MHz. Then I hit the glitch. All of the radios in my house with
external AM antenna connections are Digital Tuning. This little unit
requires (but does not mention) that you use a radio with analog tuning. I
was hoping to use it in the car, but both cars also have digital tuning.
Aaargh! My two choices seem to be: design an alternate crystal-based
oscillator or design a PLL. Both of which are beyond my current
capabilities, but I'm heading to the library.

Ok, I wasn't going to follow up on this, but after reading so many, I have to.... :-)

Here's what you do --- if they flatly refuse to accept payment for their products, what else can you do? They're free....don't complain! ;-}

(btw, this response is prompted by an incident at work where a friend of mine got a cash advance of several hundred dollars, and the bank failed to get records of this to accounting...they therefore refused to accept his written statement that he had indeed gotten this money, and, after several arguments where he tried to convince them that he wasn't telling lies, they "forced" him to accept a refund of the full amount!)

If someone insists on giving you something for free, even when you try to pay for it, hey...don't complain!

Hi world,

I've got a couple of motorolla ht-220's which have crystals in them
for 16x.xx. We would like to use them on 155.xx. Does anyone know if
it is as simple as just changing the crystals and tuning the thing?
If so, can someone give me some tips on tuning them?

Thanks much,
/Steve

I hope you can come up with something. Offhand, I can't imagine what that
would might be that is not already be in the Rutgers maps, but good luck.

That FCC BBS is not worth much. I've yet to see anything affecting ham radio
except possibly the WARC-92 thing.

BTW, I'm already making good use of the House of Representatives map to send
e-mail to my Congressmensch Marcy Kaptur to ask for consumer protection
legislation controlling the Lotus CDROM thing. It will also be used to
support HR-73, the bill to outlaw further reduction of ham bands by the FCC.

I used marcy.kaptur@house.UUCP. We'll see whether that reaches her.

1. Lets stop complaining here in this notes file about code / no-code.

2. All efforts to support either code or nocode should be directed to the FCC, the ARRL, and others who can HELP make whatever you support happen. (Get involved)

3. If each of us spent the amount of time doing as opposed to complaining here look how much activity would really happen, and maybe the HOBBY would be better for it.

I wonder if a super-simple homebrew 2-meter transmitter might be feasible.

Motivation: Many new hams already have a receiver (a scanner) but no transmitter, and would like to talk on the local repeater.

Approach: Get a scanner crystal that is designed for 10.7 MHz above your desired transmit frequency. E.g., if you want to transmit on 146.000, get a 156.700-MHz scanner crystal.

This will oscillate (in overtone mode) at (156.7 - 10.7) / 3, or
48.66667 MHz. Triple this, and you're on 146.000.

For modulation, use either a varicap in the crystal circuit, or some
kind of reactance phase modulation.

Power output could be very low; even 0.02 watt will work the local repeater.

In sum, something comparable to a baby monitor transmitter would help
new hams get on 2m. Comments, anyone?

One reason you see that "gap" is time. I will admit that is not the
only one. I am in the middle of that gap and I only seem to
operate during drive time on 2m/70cm bands.   For me time is a
premium. A lot of times, I have a hard time trying to tune in the
FM net on a Sunday evening. I can see myself enjoying a lot of
hours in front of a rig when I get the kids out of the house!
(around early fifties). I guess that is a problem when you have a
lot of interests competing for the two hours in the evening after
kids are in bed and couple of hours to spend by yourself on a
weekend.

>Butternut vertical and you'll have 80 and 40 as well." Can anyone offer a
>comparison of the Cushcraft and Butternut verticals?

Steve, you must read the additional information! The R-5 is a 5-band HALF WAVE antenna! It needs NO RADIALS !!!!!

The Other verticals are nominal QUARTER WAVE antennas which REQUIRE!!!! 1/4 WAVE RADIALS--preferably a minimum of four per band. I believe if you look carefully, that the Butternut, Hy-Gain, and even Cush-Craft verticals do not yet have the WARC band capability. The other problem, as I see it, is the 25 kHZ you get on 80 meters (remember, these are SHORTENED quarter wave antennas!!!) just isn't worth the hastle of setting out 20 meter long radials.

Mounting of the R-5 is according to your circumstances. I have mine on the chimney at 35'. Others have them on the top of the mast on their towers. The higher--again, my opinion--the better. Consider putting an AP-8 at 70' some time. Where do you put the radials? How do you tweak the antenna when that 25 kHz isn't the right part of the band? Why tweak? I have an extra friend with his set for the bottom of the CW band. He couldn't work me (when I had my novice) because the antenna was a dummy load for the Novice 80 Meter segment--unless he retuned the antenna--a real hastle in the snow and ice.

A downer. The R-5 doesn't cover 80 meters. Try a dipole or a full size dedicated 80 meter vertical for this. Ditto for 40 meters. Howver, for 20 meters and up, including the WARC band, the R-5 is difficult to beat.

Oh yes, oh yes! The question pool would be held in the strictest confidence, and any VE caught compromising it would have his ticket pulled. Any commercial entity who did so would get fined (like, six figures). And, the question pool itself would be revised frequently. This should pretty much guarantee that those who passed the exams KNEW the material.

To those of you who would like to get your license but could use a "tutor", I have contacted Don Stoner of NARA who maintains a database of "helping hams" (several thousand) around the US who have indicated a willingness to help perspective/new hams get started.

He can be reached at: 70371.111@CompuServe.Com
----This is a period -------^

Don will give you the names of local hams who will give you a hand, I think he likes ZIP codes, Town, and State to lookup the nearest Helping Ham.

John

There is an ARRL diamond logo written in PostScript stored on sun.soe.clarkson.edu, in pub/postscript, as arrl.ps. If you can't ftp, but can email, you can fetch it via the archive-server@sun.soe.clarkson.edu.

I didn't write it, my boss Dave <bray@sun.soe.clarkson.edu> K2LMG wrote it. The ARRL knows about it and it should be used only by ARRL members for personal use.

I would be really interested to know of an RS store that refused your cash.

My personal adage: "if it's from Radio Shack, there has to be a catch."

Forgetting that, I ran out and bought the RShack book for the General (got inspired after 15 years away from ham radio). All the books, except for Novice of course, are *upgrade* material. That means if you're working on a Tech license, you need to get the books for Novice as well if you don't already have a Novice ticket. The Novice & General books come with Morse tutorial tapes; the General builds you up from 5 to 15 wpm (exactly what I was looking for -- amazing how much code I remember after all this time!). If you're upgrading, excellent -- so far.

Here's the catch: on page 16 of the General book, in the middle of the page, away from everything else on the page, etc., it mentions that the FCC would change the question pool "substantially" as of November 1990, and that new books should be available October 1990.

Needless to say, I returned the package. The store mgr. said "I know this is the latest that's been done; can't say I blame you for returning it." Too bad the tapes were bundled -- I would have kept those. A co-worker & I are heading over to a local HR shop later this week to get the ARRL material.

So -- does anybody know if the question pool *did* change in November? Did RShack loose a sale unnecessarily? Does anyone have any HF/2-meter gear they want to give away? :-)

I received the following Voice of America schedule from E. Allen Brown (eab@voa3.voa.gov) and he gave me permission to post it to the net. I thoughtothers might find it useful, so here it is...

All comments should go to Allen at the following address:

```
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
+E. Allen (Al) Brown (VOA/BBC)      WA3FYZ/ZF2LY           Voice of America+
+Wilber J. Cohen Building, Room G-748                  Broadcast Operations+
+Washington, DC 20547                             Computer Services Division+
+eab@voa3.voa.gov             ...uunet!voa3!eab            +1 202-619-2020+
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
```

The following is the Voice of America broadcast schedule including language, time (UTC), frequency, transmitter site and the direction of the transmitted signal in degrees from true north.

The first column is an abbreviation for the language. For example, ALAB is Albanian, HAUS is Hausa, VEUR is English to VOA Europe, etc.

The GROUP is an internal routing flag and should be disregarded. TIME is obvious. FREQ is frequency in kilohertz.

SITE is the transmitter site. For example, WOF is Wofferton, England; TAN is Tangier, Morocco; GR is Greenville, NC; PHL is Philippines; KAV and RHO are Kavala and Rhodes, Greece, respectively.

And, as I alluded to above, AZI is the azimuth of the major lobe of the transmitted signal.

If you can't figure out the other abbreviations and need to know, send me a mailnote and I'll pass the information on to you.

73 and good DX.

Try:

Transverters Unlimited
Box 6286, Station A
Toronto, Ontario M5W 1P3
Canada
ATTN: Hans Peters

They make a variety of UHF/VHF kits, including transverters. I have a set of their 900 MHz transverters for a pair of 'DSY modems I'm working on, but I haven't had time to get them running yet. They import their goods from SSB Electronics in Germany, and as a result, the instructions are in German with an English translation! The kits are complete, but Heathkit it ain't.

As quoted from <649@chiton.ucsd.edu> by rec@chiton.ucsd.edu (Richard Currier):
+---------------
| Dan, haven't you noticed that the more advanced a civilization gets, the more
| restrictive is regulations become. Any highly evolved extra-terrestrial hams
| out there are going to have CCNR's, power restrictions, and band limitations
+---------------

Any civilization that is so distrustful of its members that it needs all that legal baggage is far from advanced. Any civilization that actually requires all of that to remain functioning (like, say, ours) is almost beyond hope. :-(

I like your idea of a "Committee of 100," a self-organized and self-funded body to advise the FCC about ham radio. Crucially, it should have no other purpose -- no close ties to a publisher, or an equipment vendor, or anything like that.

We deal with a similar concept on campus when we recruit committees to advise the administration about computer planning and networking. The idea is to get a "zoo," i.e., a sample of as many different kinds of computer users as possible. I'm a member of several of these "zoos" -- apparently I'm a fairly exotic beast.

This has always worked for me (with telephone handset cords):

Unplug the cord, if possible, at the Xmitter (Phone Base) end.
Hold the cord so the mike (handset) is allowed to dangle. Let
it reach its equilibrium by spinning.

To remove each kink, work the kink all the
way to one end of the cable (where it will disappear!). Sometimes
the kink will cancel with another before you get to the end.
This is very time consuming, but works very well. Unfortunately,
it's very hard to do while talking on the mike!

To keep the cord from kinking up again, periodically dangle the
mike as above and allow the cord to spin and reach equilibrium.

Cheers!

```

In <luigi@aix03.aix.rpi.edu (John L Luigi Giasi)> John quotes:

Subject: A Bill in Congress!!! (HR 73)

>From Tom Freneye K1KI the WMA saction manager and New England Division Director
>
>Representative Cooper (D-Tn) introduced a House Resolution on January
>4th, the 1st day of the new Congress which has been assigned the number
>H.R. 73 (!)
>
>HR-73 - The Amateur Radio Spectrum Protection Act of 1991 - if adopted by
>Congress, provides that the FCC is forbidden from reallocation of any

>spectrum away from the Amateur Service without providing for replacement
>spectrum.

(rest of quote deleted)

>Finally an issue all hams can agree upon?? I hope so.. this would be
>outstanding to say the least!!!
>Hopefully I will get some more info tommorow morning when I talk to Tom.
>Lets break out those Congressman addresses and start writing.
>(And Congresswoman)

This is good news. I hope that Tom is aware of the pitfalls of the term "replacement spectrum", though. I wouldn't want to swap the 500 kHz from 3.5 to 4.0 mHz for a replacement 500 kHz on 10 cm.

73,
Dube   N5PDK

Want to give odds that it'll be rockbound, and that the rocks will be $50 a pair (with a maximum of 5 pairs)? I bet 2m simplex SSB will get real popular real fast in certain circles (see you on 144.200).

Watch out for those cheap ICOM rigs. When a friend of mine was looking for
an inexpensive rig, we looked at the Kenwood TS-140, YAESU and ICOM. The
most striking feature of the ICOM is it had no IF Shift! We immediatly
dismissed the ICOM as one of the rigs to buy. He ended up with the Kenwood
and likes it a lot. 73 WF2V Len

Relax. It is still listed in the 1991 Callbook, so it didn't really expire
4 years ago. It must have been grandfathered. I would renew it right
away though.

Hi,
Just thought I would bring folks up to date on my previous inquiry.

First, as confirmed thru my VE and mentioned in a club meeting last Sunday by the Norther N.J. section manager there is no prcedure in place for those who have previously passed elements 2 and 3a to file a 610 form. The VE's are only required to sign and send one in if an applicant has passed a unit which they administered.

The section manager's suggestion was to have the individual fill out the form 610 himself, attach a copy of the CSCE and forward it to the FCC for processing. Basically, he said they made the mess and now they should figure out what to do.

I did receive a number of replies which indicated that some VE testing sessions were planning to give the elements and then hold onto the paperwork until 2/14 when they could be submitted. DON'T DO THIS!!!

Anyone doing this is violating the rules which state that the VE has five (5) days to get the completed paperwork to the VEC who then has x days to get it to the FCC. You may have good intentions but it is against the rules. And, if you "stretch" the rules here, where else will it lead ...

Lastly, as part of my original post I asked for info. on how to get in touch with the FCC. A number of people have responded in a very strong fashion, both on netnews and via email. In summary, they all said that calling the FCC was the last thing on earth I should think of. Who knows, I might get them to make some kind of interpertation which would negatively impact the hobby!!! (heaven forbid)...

Well, sorry folks, but I for one prefer not to run scared of the "big bad" FCC. After all, even if I wasn't a ham, I am a tax payer. And as such have every right to query this govermental agency regarding the rules that they set up for any service. Being a ham, with a personal stake in this makes it even more imperative that I speak with them. I am doing so and will let everyone know what, if anything I find out. To those who wrote I think it's time to stop being "scaredy cats"...

To those of you who have already sent me info. directly or via a post to netnews I thank you. It's nice to know that there are people out there who care to help. If anyone else has any official info. from a VEC, the FCC, or VE on how they plan on handling this please let me know and I will summarize in a post for all.

An alternative is to hold onto the microphone, and dangle the rig out the
window, letting it spin until it reaches equilibrium.

Has any one modified the PK-232 to display a gray scale
instead of the black and white only pictures ? This would
be great for WEFAX and SSTV !!!

Should I just sell my PK-232 & PCPAKRATT II and get the MFJ
unit that does 8 shades of gray ?

I want detailed info on how to decode the phone number of the person calling when my phone rings. so far i understand that the data comes between the 1st & 2nd rings and that it is tone encoded.

Does it use telephone dialling tones of which there are 7 that come 2 at a time? Or modem tones--what baud rate?
What is the tone encoding? Is it ascii data or BCD?

Are there any mags. that explane the system?
Has the FCC written an OST on the subject?

I think the device in Nuts & Volts is overpriced. I'd rather make my own.

This is a great idea. Actually, getting into homebrewing is easier today than ever before. There are many good references available today (Demaw,Hayward and many others) that are well written introductions to building low cost simple HF gear and accessories. There are companies that will sell the PC boards and components for some well known designs to get new homebrewer started. Building and understanding a few basic designs from available kits is a good start on the road to homebrewing your own designs from scratch. In fact, a great place to start is the keyer in the November issue of QST. This little unit looks so nice I'm going to have to build one for myself.

Now for a note of irony. The best way to learn about building HF transmitters is to start with (the outmoded mode) CW gear. Thats why you will hear so much activity around the QRP CW frequencies. I deliberately haunt the QRP CW freqs as I find the most interesting people there. I am constantly amazed by what some OPs have designed and built and put on the air. You won't find that kind of activity on the phone bands.

Now for another even heavier note of irony. If the current attempt to drive CW off the air to make room for the expanding digital and phone modes succeeds, it will also eliminate the only watering hole for HF experimentation and learning. There is a small anti-CW faction doesn't just want to eliminate the CW licence requirement for above 30 Mhz which I support,they want to eliminate CW operation period as being a useless and archaic mode. Since they don't operate CW they are not aware of the large volume of CW activity that is going on and the useful place CW occupies in the Amateur Radio Service. If they win, we all lose. But thats politics.

Sorry Michael but if you do your homework you will find that the largest number of people who are into homebrewing on the HF bands start out by building simple CW gear. If you take the time to actually talk to the people that you will find hanging around the QRP CW frequencies it is there that you will find some of the most technically proficient hams on the bands. Its too bad that your anti-CW attitude will always prevent you from meeting the kind of people you say you want to see more of in Amateur Radio. Well, they are already there and they would be happy to see you join them. Please give yourself a break, get out your key and explore the opportunities that exist on the CW bands before you write the mode off as useless or worse, actively join the ranks of those trying to destroy it.

Let there be no mistake here, I and many other CW OPs SUPPORT the new no-code licence, will welcome any new hams with the licence with open arms and will smother them with our enthusiasm for ALL of the many modes available to them as new hams.

I'm waiting for my license now, and already have built a QRP CW transmitter for 10 meters. I was looking extremely forward to discussing construction techniques, design ideas, and so forth with other avid builders.
>

Welcome, welcome to the ranks. Be sure to hang around the QRP CW frequencies when you get on the air. It is here that you will find the largest concentration of homebrewers. They will chew you ears off about all the things you are interested in and don't be surprised it they suggest a shift to packet, phone, amtor, 2M FM etc. for alternate modes of operation. These guys don't like to limit themselves in any way.

>
> Homebrew allows ANYTHING! However, I do think some spectrum space reserved for hams who have passed an EXTREMELY rigorous technical exam (one involving heavy duty questions about circuit theory, construction techniques, and so forth) would be great. This license class should require only the 5 wpm minimum code, and ANY emmission should be allowed there. In other words, anyone who has the technical punch to homebrew should get to strut his stuff in the "Homebrewer's band'.

An excellent idea that I have been hearing more and more of lately. If we are serious about bringing in new generations of technically motivated hams we may need to provide the playground for them to expand their skills and exercise their interests.

>REAL hams know how to build radios!!!

Sorry to keep harping on the point, but most homebrewers start out by building simple CW rigs. There are many reasons for this but the bottom line is if you want to build radios for HF operation you will have a very hard time maintaining your anti-CW attitude. The only snobbery is in your own mind. Please give the mode a break. CW OPs are the least elitest, most open minded group of hams you will find. Don't take my word for it. Break out your key and give it a try.

I don't think anyone says it is "useless" - only that it is not meaningful to test for code ability for VHF only licenses.

There's a difference.

Well, you need to prevent the oscillator from being pulled in frequency
by the load so you need a buffer stage. Since you're going to add a stage,
you might as well order fundamental crystals for 48 Mhz and follow with
a tripler stage, and output stage, and a little matching. This will easily
get you to the 1 watt level. You need a microphone amplifer, a FET should
do. So now you've got a four transistor, one watt transmitter with only
two tuned circuits, tripler output and final output. Not bad. All new parts
cost under $25. If you eliminate the final amp and take the output from the
tripler, you would have about .05 watt, but it might be a little dirty
since you would be down to one tuned circuit. Not an ideal state of the
art design, but it should be functional. There's probably a single IC
that would do it all.

```
mic|--|AF amp|--|Xtal osc|--|tripler|--|LC|--|PA|--|LC|--|ant
```

A better circuit would use a 6C10 with the first section being the
speech amp, the second section the oscillator, and the third section
the tripler. Follow with a 6146B PA and you have a two tube 60 watt
FM transmitter. Now that's simple! :-)

Or even better, use a pentagrid converter tube with the tube serving
rentrantly as AF amp, oscillator, tripler, and final. :-) :-)

It's real nice that we now know how you got the message, but
is it really necessary to post 38 lines of routing?

It would be even nicer if the ARRL had a subject heading
that could be used, so we could skip the whole thing if it

wasn't relevant.

You can get this info (for a price) from the Radio Amateur Callbook company.
Also, Buckmaster Publishing, Mineral, VA 32117 (703) 894-5777, publishes
the US callsign listings sorted geographically (by state, town and
street). I have bought this list in microfiche form, and I believe
they have it in printed form as well.

The changes in the question pools are technically insignificant. A reading
of the rule book will help with any part 97 changes.

If you actually know what a fraction of what you should know to be a
decent amateur operator the test should be no problem at all.

If you plan to memorize enough to pass, well, shame on you.

If all you want is the question pool, with answers in the rear,
recommend the W5YI set.

For learning material, I recommend ARRL.

And get an ARRL Handbook - and read it.

And get an ARRL Antenna Book - and read it.> --

There is another "feature" of the MFJ1278 that I'd like to comment on. In CW mode it supports "full break in". What this means, is that the PTT output pulses right along with the keying output! Now, this is fine for a modern rig that supports full-breakin, but on an older radio like my TS830, it's liable to wear out the transmit/receive relays FAR before their time. Now, there _are_ workarounds. For example, in the particular case of the '830, one could just disconnect the TNC from the radio mike input, turn the VOX on, and let the CW waveform switch the rig via the radio's "semi-break-in" feature. Or one could build a gadget with a 555 timer to produce "semi-breakin output". OR MFJ COULD HAVE JUST BUILT IT INTO THE FIRMWARE!!!!

SPECIAL SOLAR TERRESTRIAL BULLETIN

Information Update
08 January, 1991

/\/\/\/\/\/\/\/\/\/\/\/\/\

SOLAR CONDITIONS AS OF 08 JANUARY, 1991.

As was anticipated, Region 6442 (S11W59) began producing M-class flares on 08 January. It has produced three M-class flares over the past 24 hours. The first flare occurred at 04:34 UT and lasted 61 minutes. It achieved a class M1.8/1N intensity and was associated with a 640 s.f.u. (solar flux unit) radio burst at 10 cm wavelengths. The second flare occurred at 06:56 UT and lasted 20 minutes. It was rated as a class M1.1/SF flare and was not associated with any significant radio bursts. The third flare occurred at 11:27 UT and lasted 32 minutes. It was rated as a class M1.2/1N flare and was associated with a 1,100 s.f.u. radio burst at 245 MHz. The locations of these flares were at S11W48, S12W50 and S13W51 respectively. Region 6442 has begun to slow in growth and is expected to enter a decline phase after it passes beyond the west limb on 10/11 January. However, it is expected to continue to produce M-class flares throughout the remainder of it's transit over the west limb.

Of perhaps equal importance were the events which have transpired over the eastern solar limb. Region 6444 (N14E65) has rotated into better view now and has revealed numerous additional trailing spots. It is not yet clear whether the trailing spots are associated with Region 6444 or with old Region 6412 (which produced two powerful X-class flares just prior to it's passage beyond the west limb two weeks ago). This determination will be made clear over the next 24 hours as the eastern regions rotate into better view.

An eruptive prominence occurred on 08 January from behind the east limb. This event was associated with a long-duration class C7.5 x-ray burst, which peaked in intensity at 18:48 UT. The event lasted 72 minutes and managed to push the background X-ray flux for 08 January to a class C2.3 level (well above the C1.5 background levels measured on 07 January). In addition, this eruptive prominence was associated with a strong Type II radio sweep.

It will be interesting to observe the emergence of these eastern active centers over the next several days. The threat for M-class flaring is expected to remain high for at least the next 48 hours, and likely throughout the next week. The current sunspot number is 145, but is expected to climb quite dramatically over the next 48 hours, before levelling off. The disappearance of Region 6442 beyond the west limb will produce a drop in the sunspot numbers, but Regions 6444 and the active area's just beyond the eastern limb are expected to keep sunspot numbers elevated.

STRATOSPHERIC WARMING ALERT UPDATE - 08 JANUARY, 1991.

The stratospheric warming alert is being continued. This alert will likely remain in effect for at least the next 7 to 10 days. The stratospheric warming has become very intense with a center over Greenland. The affected area's are continuing to expand and spread northeastwards.

For those who are unfamiliar with stratospheric warming alerts, here is a brief explanation of these events. A stratospheric warming alert is issued whenever abnormally high temperatures are observed in the earth's stratosphere, which is the atmospheric transition zone between the trophosphere (the lower atmosphere we live in) and the ionosphere. Large area's of intense stratospheric warming can cause atmospheric expansion sufficient to increase drag on satellites. There is also some evidence that intense stratospheric warming events can cause changes in atmospheric circulation and weather patterns. This area is still being researched however, and is far from conclusive.

Intense solar activity can cause atmospheric expansion. However, stratospheric warming events are more often associated with natural processes occurring in the earth's atmosphere. Stratospheric warming tends to occur most often during the winter months and can appear quite suddenly and intensify quite rapidly. Abnormally high temperatures in the stratosphere cause changes in stratospheric circulation patterns and other characteristic changes. They pose no threat to man, but do warrant attention.

Stratospheric warmings are relatively rare. The last stratospheric warming alert was issued on 08 February, 1990 and lasted for over two weeks. This event is expected to be of a similar duration. We are in day 6 of the "Stratwarm Alerts" as of 08 January, 1991.

It seems to me, that the "last four digits" they're asking for are just a hash code. They're not going to use them to call you up, because they're lacking three digits. It's just a way to get to the store's database, so that it can print out your receipt. Once you give them the #, they get a display with the few people who have the same number, and ask you which one you are. Now, this scheme _could_ be sabotaged, if everybody gave the same number. Then the hash wouldn't be random enough anymore. But why bother? At least it saves them from having to scribble down your name and address every time you buy something, given that they're committed to getting that information. And they HAVE been committed to getting that information ever since they became a national chain. This "last four numbers" business is just a streamlining of the old procedure.

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
```

The following is the Voice of America broadcast schedule including language, time (UTC), frequency, transmitter site and the direction of the transmitted signal in degrees from true north.

The first column is an abbreviation for the language. For example, ALAB is Albanian, HAUS is Hausa, VEUR is English to VOA Europe, etc.

The GROUP is an internal routing flag and should be disregarded. TIME is obvious. FREQ is frequency in kilohertz.

SITE is the transmitter site. For example, WOF is Wofferton, England; TAN is Tangier, Morocco; GR is Greenville, NC; PHL is Philippines; KAV and RHO are Kavala and Rhodes, Greece, respectively.

And, as I alluded to above, AZI is the azimuth of the major lobe of the transmitted signal.

If you can't figure out the other abbreviations and need to know, send me a mailnote and I'll pass the information on to you.

73 and good DX.

mcovingt@athena.cs.uga.edu (Michael A. Covington) writes:

>I wonder if a super-simple homebrew 2-meter transmitter might be feasible.

>Motivation: Many new hams already have a receiver (a scanner) but no
>transmitter, and would like to talk on the local repeater.

>Approach: Get a scanner crystal that is designed for 10.7 MHz above
>your desired transmit frequency. E.g., if you want to transmit on 146.000,
>get a 156.700-MHz scanner crystal.

Not necessary. The stuff is already available. Hamtronics has $50 transmitter strips that are very nice with 1 watt out. For a little more, one can get a complete Ramsey 2 meter synthesized radio kit for about $140 or so. And building the kit would give 'em a good dose of solder smoke, an essential ingredient in the initiation process.

What bothers me about this theme, however, is that it falls right back into the stereotypical ham operator poormouthing. It is very unlikely that many barefoot bums are going to rush into ham radio and then want to buy a rig with their wine money. I challenge anybody with enough wherewithall to pass the exams NOT to be able to come up with a hundred dollars or so for a used rig. And if isolated case do pop up, it is tradition for the hams in a local area to loan and/or give the new ham enough equipment

to get on the air.   I know that when I got my ticket, I was deluged with
boat anchors that I graciously accepted and used. There just ain't no need
for charity radios.

John

IMHI, ours is becoming a "black box" society (if we aren't there already!). We
now balance the cost of throwing away an item or sub-assembly against the cost
of repair. The busy person is the one who can repair those "black boxes" for
half the cost of a new one, and still make a living wage. How many Hams
repair their own equipment? How many automobile owners repair their own
engine computer?

Here's a (perhaps remote) example of what I mean: My XYL's car has an automatic deck lid closure that is motor-driven. It failed due to breakage of a CHEAP! plastic gear. Dealers told me that this gear was impossible to get, and that it would require replacing the entire assembly ($200). Yet the part was easily accessible, and easy to remove and replace! To make a long story short, I finally obtained the part through the auto manufacturer, and spent about 20 minutes (including R & R of the assembly) to fix the thing.
(P.S. If yours is broken, I'll fix it for $100, you ship)

The point is, that we seem spring-loaded to the "throw-it-away-and-buy-a-whole-new-one" position. Or, we technically-inclined folk dash it off to the nearest fix-it guy rather than doing it ourselves (and thereby probably getting a poor job than we could do).

I have never had a K-Mart, Sears, etc, salesperson refuse to make a cash sale to me. I HAVE had Radio Shack people refuse CASH. Why? Because I wouldn't give them my name and address. No, cash being waved in their face is NOT sufficient to buy something from Radio Shack.

> RS's policy on refunds and warranties is also quite
> beneficial to the customer, particularly if you complain to the district

I complain VERY loudly whenever they refuse to accept a cash transaction. Has anything changed? Ha!

I too, used to have similar problems, living in an assortment of rented apartments. Since I bought my house, I have come up with the following algorithm for getting cables in and out:

```
cable_in_out()
    {
    obtain power drill with long 1/2 inch bit;
    apply drill to wall;
    while( drill not through wall )
        {
        press button on drill;
        }
    }
```

(AHHH! didn't that feel good?)

>no credit for past examinations.

The problem is that no-code Techs will be required to memorize
frequency allocations that they will NOT be able to use.   After answering
questions on how to call CQ using CW and what privileges are allocated
for the 40 meter band, it would not be unreasonable to expect that
a no-code Tech would assume that he had authority to use 40 meter CW.
(or phone on 10 meters)

For this reason, we need to change element 3A to make it clear that
no privileges are granted under 30 MHz.

They are REALLY that good. I use one up 10' at the base on a fence post. I put it up at night due to antenna restrictions and work on wires in the daytime. Satisfaction here is total after several years of operation. SWR < 2:1 on all bands and easy to assemble and install. Get if you can't run a beam on a tower.

It is AGAINST THE LAW in both Canada and the United States to refuse a cash transaction in this context. Under the strictest legal interpretations, if they refuse cash you are legally entitled to walk from the store with your purchase in hand, because they have 'refused payment'.

Essentially, by refusing to accept cash they are giving you your purchase for free!

As with all free legal advice; caveat emptor. I have never tested this in court, although the bluff has always worked.

Greetings...

I am looking into the requirements for obtaining a ham license of some
sort. I am not familiar with the types of licenses, their priviledges,
and their technical requirements.

Could somebody summarize, or point me to a reference which summarizes:

(1) What types of licenses are available (amateur AND commercial)

(2) For each license, what academic/morse requirements are there
     (opinions about the difficulty of the tests are welcomed)

(3) What are the operating privledges for each license, including
     frequency bands, types of operation (e.g. operation only,
     adjustment and operation of equipment, etc.) and for what type

of equipment is one licensed.

(4) Any other information you think would help...

I have a BS EE so the theory shouldn't be too terrible, and I have no qualms about learning the morse code (of course, I have not tried it yet :-)). I have never dealt with radio, however.

Thanks for any and all advice.

Good point. However, I don't think we'll ever get completely non-technical as a culture, any more than we would fail to have auto mechanics. There will be a niche, a need, for both auto mechanics and (radio) technologists in each "home town". Still, I agree, the trend seems to be away from technical interest and understanding.

Gary:

> What is a bad thing is that our culture is turning away from
> technological play and thus turning away from learning technological
> skills...

Fascinating observation.

> Bringing the the people back to radio toys can have very positive
> results on the competitiveness of our society.

I do this myself in small ways. I make frequent, visible use of my HT and I explain to people what it is. I help people make phone calls through a patch when warranted. I show it to elementary school kids when I visit to do educational scrap parts auctions. Stuff like that.

I picked up an old Appolo 6/10/15 meter linear, not know weather it worked or not, but ir was cheap, so I wasn't worried about it.

I got it into my radio room for a disection, and there have been hands in there before mine for sure, it appears to have been retrofitted with a COR, the 10 meter has been disabled (Simply had the contact on the switch removed), and the (now impossible to get a reference on) transformer is a good subsitute for the fine Stanford Mesquite Charcoal.

The transformer is of Motorola decent, and bears the number:

25D65663A03-P, goes on to say 118 V 60 Cy and then gives another number
549-6130

It appears to be a television transformer, and I have no other info on it other than that. The PA itself is a very simple, but effective arrangement of 2 6LQ6's, ala Push Pull.

Hopfully someone can either find a replacement for it, or at least tell me what 2 6LQ6's should draw, and where. I have pinouts of the tubes, and some limited information, including direct ref. replacements.

Here's what I have on the 6LQ6's:
Reference to: 6JE6B 6JE6C 6LV6 6ME6 6MJ6
Plate Dis: 30 Watts, Screen Dis: 5 Watts, Trans Inductance: 9.6K
Filiment/Heater:6.3 Volts at 2.5 amps

Please reply to system@hale.UUCP as I cannot recieve rec.ham-radio there, and have have to go to another system to get it. (Where I am now actually.)

A few days ago, I mentioned in a rec.ham-radio posting that I will no longer be maintaining lists of Macintosh and Apple II ham software, as I've done for the past couple of years.

Since then, I've received several requests for the lists, so I've decided to post them once more for the benefit of netnews newcomers. I hope someone will pick up the ball and update the lists as new programs are released.

Because some of the programs may be of interest to non-hams as well, I'm including r.r.sw on this distribution.

Patty

Apple II Amateur Radio Software
List compiled by N6BIS, last updated 1/7/91

The information in this list was obtained mostly from flyers supplied by the software vendors, or in some cases from reviews in QST. Please check with the vendors for the latest product details, pricing, etc.

>>The products in this list are not endorsed by Apple Computer, Inc.<<

PACKET RADIO

APR (Apple Packet Radio)
For use with TNC-2s. Requires a Super Serial card in the computer.
Larry East, W1HUE, P.O. Box 51445, Idaho Falls, ID 83405-1445.
Send a blank 3.5-inch or 5.25-inch Apple II disk and a stamped,
self-addressed disk mailer.

PACHAM
Uses a two-microchip interface instead of a TNC.

DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

MORSE CODE PRACTICE

Morse+Plus Morse Code Tutor
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$15.95

[The Sept. 7, 1990 _ARRL Letter_ mentioned that the Computer Foundation for Handicapped Children has some Morse code programs for the disabled. Contact them at 2645 East Southern, Tempe, AZ 85282 for details.]

MORSE CODE & RTTY OPERATION

HAM
Sends and receives both Morse code and RTTY.
DaJu Development Company, 39 Long Ridge Road, Carlisle, MA
01741. $49.95

Code Machine
COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount
if bought in conjunction with another COTEC program)

RTTY Machine
COTEC, 13462 Hammons Ave., Saratoga, CA 95070. $29.95 (discount
if bought in conjunction with another COTEC program)

SATELLITE TRACKING

Apple QuikTrak
AMSAT, PO Box 27, Washington, DC 20044. $25 for AMSAT
members; $35 for non-members

ANTENNA DESIGN

Antenna Design & Dimensions
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$9.95

Antenna Trap Designing
Larry East W1HUE, 119-7 Buckland St., Plantsville, CT 06479.
Send blank formatted disk with stamped, self-addressed return
disk mailer.

LOGGING

Electrolog II

EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$18.95

Contest Log & Dupe Sheet
EPO Software, 7805 NE 147th Avenue, Vancouver, WA 98682.
$13.95

Macintosh Amateur Radio Software
List compiled by N6BIS; last updated 11/24/90

The information in this list was gleaned mostly from flyers supplied by the software vendors, or in some cases from reviews or listings in QST or AMSAT Journal. Please check with the vendors for the latest product details, pricing, etc.

>>The products mentioned here are not endorsed by Apple Computer, Inc.<<

PACKET RADIO

NET/Mac (KA9Q TCP/IP)
Supports AX.25 and NET/ROM as well as TCP/IP functions. Requires a TNC with KISS mode.
     Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129.
Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer. Also available via anonymous FTP from apple.com

(/pub/ham-radio) and platypus.uofs.edu (/pub/HAM-RADIO); on the Digikron Systems BBS at (408) 253-1309; the WB3FFV BBS at (301) 625-0817, 625-9482, and 625-9663; and the N8EMR BBS at (614) 895-2553 (or via AMPR.NET FTP at 44.70.0.1).

The KA9Q package is copyrighted, but free for noncommercial use.

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes computer-to-TNC cable.

Advanced Electronic Applications (AEA), PO Box C-2160,
Lynnwood, WA 98036. $59.95

MORSE CODE PRACTICE

N6MZV Morse Trainer
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014.
Also available via anonymous FTP from apple.com (/pub/ham-radio).
$25.00

Morse Tutor
Jack Brindle WA4FIB, Brincomm Technology, 3155 Resin Street,
Marietta, GA 30066. Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer. The program is copyright, but free for noncommercial use.

MacMorse
David A. Kall, 700 Marine Parkway #314, New Port Richey, Florida
34652. $29.95

Zihua Morse
Zihua, P.O. Box 51601, Pacific Grove, CA 93950. $39.95 without speech synthesis; $65 with speech synthesis.

RTTY

MacTTY
Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.
$39.95

LOGGING

LOGic
Personal Database Applications, 2634 Meadow Bend Court, Duluth,
GA 30136. $75.00

FDLog!
System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN
55443. $29.95

SATELLITE TRACKING

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT
members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015.
Send formatted 800K Macintosh disk with stamped, self-addressed
return disk mailer; or send SASE for source listing. Requires
Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702.
$10.00

MacSat 3.0
Geodetic Research Services Ltd., P.O. Box 3643, Station B, Fredericton,
N.B. E3A 5L7, Canada.
$50.00 (add $10.00 for airmail postage and handling)

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

PROPAGATION, GRAY LINE, DX HEADINGS

DX Window
Creates on screen an azimuthal equidistant projection (great circle)
world map centered on your QTH, with day/night terminator.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the
world.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95
($59.95 with Skycom 1.5)

Skycom 1.5
Provides sunlight status at both ends of the path; MUF, F0F2, and FOT
frequencies; S/N ratio of the link, and other information.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95
($59.95 with Skycom 1.1)

DX Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98336. $34.95

Sun Clock

Desk accessory. Displays a map of the world with day and night areas.

MLT Software, PO Box 98041, 6325 SW Capitol Highway, Portland, OR 97201. $17.00

RADIO CONTROL

ICOM IC-735 Control
KE6FG Software, 9763 Pali Ave., Tujunga, CA 91042. $49.95

TEST PREPARATION

Ham Stacks
HyperCard stacks containing all of the questions in the current question pool for each license class.

Diana Syriac N1GZS, 49A Meadow Pond Drive, Leominster, MA 01453. Send two formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Also available via anonymous FTP from the pub/ham-radio directories on apple.com and platypus.uofs.edu.

COLLECTIONS AND MISCELLANY

MacNet
Public-domain programs (currently on nine disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television.

John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH 03103. Send formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Contributions of public-domain programs encouraged.

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many (but not all) of the programs.

Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716. Send three formatted 800K Macintosh disks with stamped, self-addressed return disk mailer.

"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, Novice, gray-line, satellite tracking, contesting, packet, and CW programs.

ZCo Corporation, PO Box 3720, Nashua, NH 03061.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator, and pad design programs.

Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Red Ryder 9.4
Terminal emulation program, suitable for packet radio.

Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

MacScience BBS
Various ham-related applications, including antenna design,
propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation,
Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse
code applications. (301) 625-0817, 625-9482, and 625-9663.

N8EMR BBS
Various ham-related files, including packet, Morse code, DXing, and
contesting software; AMSAT bulletins; and several ham newsletters.
(614) 895-2553. Also available on AMPR.NET at 44.70.0.1.

I assume this is for their flyer mailing list?  Make something up.
Usually, it's easier to work around a problem than bash your head
against it.

The Ultimate is to give them a name and/or address with a
double-entendre or reads something else backwards, but they don't
catch on till your out the door. :)

I don't have experience with the Butternut vertical, but I do know that it's not a 1/2 wave vertical. The advantage of the R-5 is that, being a 1/2 antenna, it doesn't require a ground plan to be effective. This allows the antenna to be mounted, without radials, at almost any height without significant effects on performance. Mine is mounted 25' off the ground at the edge of our roof. It works great. The night that I put the antenna together I mounted it on a step ladder (about 5') and worked DX on 20m. It's an expensive antenna. But considering the ease of installation, it's worth every penny.

I am looking for documentation/manufacturer/prime contractor on the LLWAS system. That stands for Low-level Windshear Alert System. LLWAS data towers are located in a giant ring around selected airports (here in Austin for example). The LLWAS towers time share 162.325 MHz and transmit low speed digital telemetry to the airport tower (or somewhere!).

A simple DSP modem could decode this stuff easily...I just need to know the modulation format and more importantly the DATA format. Any info would be appreciated!

The e-mail bounced...to the person asking about the ICOM R1:

An active antenna for HF is recommended. The R1 gets overloaded pretty easily and an active antenna/preselector is recommended to help reject unwanted strong signals. There is a manual available in FTP form from somehwere but I don't remember where.

I have listened to aircraft beacons in the 200-400KHz range using the R1 and an active VLF whip I designed. Beware of strong AM stations overloading in this range however. Also gets overloaded on adjacent channel VHF/UHF signals...like the IF is too wide or something.

I, too, would like to encourage homebrewing. (The CW debate convinced me that ham radio has *already* turned into CB, i.e., near 100% appliance operation, with Morse code rather than technical knowledge as the hams' claim to fame!)

I'm thinking about a simple 2m FM transmitter, very low power. I know that 0.06 watt is sufficient to work the local repeater. Also, many new hams already have scanners to listen with... the transmitter can't be too hard.

Not having tried much VHF homebrewing yet, I may be in for some surprises, but it seems to me that because of miniaturization, it's probably no harder to work at 145 MHz today than to work at 20 MHz using older homebrewing techniques (tubes and metal chassis).

Maybe we could at least have some kind of contest or rally, analogous to Field Day, for homebrew equipment only.

Indeed. The League was right when they said that the FCC apparently relied heavily on the QCWA's comments in drafting the Report and Order.

I read the QCWA's comments too. They didn't say all that much that wasn't also said by most of the other pro-no-code commenters. But I think the FCC didn't choose them at random when the question came up of which comments to feature prominently in the R&O. A good choice.

Phil

I am intrepedIy trying to develop a VHF/UHF antenna for my scanner. After initially devising a plan for a Log-Periodic Dipole, I became discouraged with the number of elements and size of the array. I am considering taking several verticle antennas set for various frequencies and feeding them with one coaxial cable. How would one go about feeding several VHF/UHF anteas? Can anyone make a guess on the antenna impedence? Thanks. -Atjmw3@alaska-

Icom's been pretty responsive to me, I've forwarded the article to Bill, and got this reply, as usual, he's interested in fixing icom problems. If you drop him a line or call, I think he'll take care of it. you can see his compuserve id, or ka2qhd!icom will route thataway too.
good luck.... de ka2qhd
Yea maybe i should email this,but i thought y'all'd be interested.

John,
If I'm going to help your friend with his 3210 problem I need to have his name, the serial number of the radio, and the two tag numbers from when it was in here for service.

I can then look the radio up to see what we did. In the long run the end result will probably be the same however. he will probably have to send the radio in for service again. If he does elect to send it back for the third time it is important to tell us in the note that describes the problem that we have had the radio 2 other times and include the tag numbers in the note as well.

I went through the path loss calculations a few years ago, and, to my surprise, discovered that this can actually work, under the right conditions.

I would think that any kind of passive reflector/reradiator would be perfectly legal. You could even do it for a commercial broadcast TV/FM signal. A friend of mine did this, but he added a preamp between the two antennas. Seems to me this would not be legit.

Hi all.

I am looking for a program (MSDOS based) to permit computer control of my NRD-525. I have two at present which I am playing with - Spectrum 525 and NRDGUI.EXE (which I got from Hamnet on CI$). Does anyone have any observations on the above two programs? (Particularly on NRDGUI which has now documentation whatsoever.)

Anyone have any first hand experience of these or any other programs either free, shareware or commercial?

I use Communications Manager on my Icom R-7000 and, ideally, the program for my 525 would offer similar features; scanning, memory management, the ability to produce graphic displays of frquency utilization.....

(Communications Manager, by the way, is a very good package!)

Please Email me directly if possible (this way there's less chance of my missing a message) and I will happily summarize for the group.

Thanks,
Lee

I'm in need of the U.S. Mail address for William Young, N4WMT. My E-mail bounces and I do not have access to a current call book.

If you have or know the U.S. mail address for N4WMT, please pass it along to me. Your assistance will certainly be appreciated.

Thanks for your help!

I don't have specifics available, but understand this was beaten in a few
different areas. The arguement was since business communications was
prohibited by federal law, how could they justify charging business rates.
I'd try the manager of the telco business office first, if that falls file a
clain with the public utilities commision. You may want contact the ARRL
counsel, they probaly can supply some information in this area.

>it sells a lot of tubes. Modern power tetrodes can't tolerate even momentary
>excess screen current. Some method of near instantly opening the screen
>circuit is essential to the survival of these tubes.

Don't agree with that.... First of all, grounding the Screen and putting the Cathode on a negative voltage is just a way to eliminate the Screen bypass-capacitor hence creating a stable environment. Second, never ever let the screen or any elctrode in the tube get floating. It's a way of asking for flashovers!

Grouding the Screen is used by Collins many years ago in their amplifiers already. I'am running an EME amp using this method with no problems, even when I deliberate let it flashover, the tube survives...

Please Note:

There have been a few minor changes to the reports which are worth noting. The "Graphical Analysis of Recent Geomagnetic Activity" which charted geomagnetic activity for Boulder Colorado, has been replaced with data which now represents planetary (global) geomagnetic activity. This chart will therefore better represent overall geomagnetic activity. As well, the data in this chart now follows UT time, which should make interpretation easier.

The Solar Terrestrial Forecast and Review for December 30 was not posted. Local computer problems were the cause. Things appear to be back in order now. We apologize for the delays in getting this report out. We are now back on schedule.

/\

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---

January 06 to January 15, 1991

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW FOR 30 DECEMBER TO 05 JANUARY.

A Stratospheric Warming Alert has been issued by the Space Environment Services Center since 03 January. Stratospheric warming has been observed over North America, and has been spreading over the Atlantic since then. The most recent observations (as of 07 January) indicate that the stratospheric warming exists from the U.S. and eastern Canada across the Atlantic over to Europe. The area is continuing to spread northeastwards. The alert is expected to remain in effect for at least the next five to seven days.

Solar activity over the past week has been mostly low. No significant solar events occurred. The most notable events were the disappearances of several minor filaments. The solar flux declined from an unexpectedly low value of 196 on 30 January to 173 on 03 and 04 January. The 10.7 cm solar flux began climbing on 05 January as the more active solar longitudes have begun to return. The background x-ray flux is also expected to return to near C-class levels between 06 January and 09 January.

Special late note: The background X-ray flux has exploded well above C-class levels on 06 and 07 January due to the rapid development of Region 6442 (S11W45). This region has grown steadily in size and spot numbers for several days now. Recently, however, signs of an emerging delta configuration have been observed in the trailer spot complex of this system. If growth continues, a major energetic flare may occur from this region. It has, so far, failed to produce any significant flaring. M-class flaring is expected to begin anytime from this region.

Geomagnetic activity became unsettled to active early in the week. There were no reports of magnetic storming, however. The Peak K-index achieved during the week occurred between 12 UT and 15 UT on 31 December. Most locations reached a K-index of four during this period. Recurrent coronal activity is believed responsible for those days of unsettled to active conditions.

Auroral activity remained mostly dormant throughout the week. The exceptions were 31 December and 03 January. Activity during these days approached moderate levels over northerly-middle and high latitudes. However, no significant periods of activity were reported.

HF radio propagation conditions remained normal throughout the period, excluding the period of enhanced geomagnetic and auroral activity on 31 December and 03 January. Conditions on these days became degraded. Signal flutter and fading caused signal problems over many paths. However, communication was still possible despite the degraded conditions.

VHF conditions remained normal throughout the week. No periods of enhanced SID-related conditions were experienced. As well, no reports of auroral-backscatter were received throughout the period.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity will increase over the coming two weeks as old Regions 6415 and 6412 return. Region 6415 was responsible for 7 M-class flares on it's last transit. Region 6412 was responsible for a flurry of powerful events just prior to it's passage beyond the west limb. It spawned two respectable X-class flares on 23 and 24 December and maintained notable optical and magnetic complexity.

Latest observations indicate that Region 6415 returned to the east-limb on 07 January. It has spawned only a few subflares, but is still too close to the limb to discern significant detail. It presently consists of two spots, but is already the largest region visible, covering an area of 1,080 million square kilometers. More spots will undoubtably become visible as this region rotates more into view.

The solar flux jumped dramatically over the last 24 hours, from 184 to 204 on 07 January. This increase is due (at least in part) to the rapid development and radiational output of Region 6442. The return of old Region 6415 is also believed responsible for the 20-point increase in the 10.7 cm radio solar flux.

The solar flux is expected to continue to rise for about the next 48 hours to values near 220. It should then begin to level off and begin a slight decline as Region 6442 passes beyond the west limb near 10/11 January. If Region 6412 also returns in an active configuration, the solar flux may exceed 230 (particularly if Region 6442 becomes more potent over the next 48 to 72 hours).

Region 6442 may become capable of producing a major flare over the next 24 to 48 hours, provided growth continues and the weak delta configuration intensifies in the trailer spot group of this region. A potential major flare alert may soon be issued, if conditions in this region become enhanced.

HF radio propagation conditions are becoming enhanced due to the increased x-ray background flux levels and rising solar flux values. MUF's have increased over the past 48 hours and are expected to rise a bit further before levelling off by near 09 January. MUF's will exceed 30 MHz over many paths and may approach 40 MHz by weeks end. If M-class flaring begins (as is anticipated), SID's and SWF's may begin to periodically degrade HF propagation conditions. Conditions may deteriorate somewhat on 09 and 10 January due to expected increases in geomagnetic and auroral activity. Conditions should improve again by 13 or 14 January.

VHF propagation will remain normal, with an increased possibility for flare-related SID enhancements. Barring any significant solar activity, there are not expected to be any significant opportunities for auroral backscatter. Best chances will occur between 09 January and 12 January. There is a possibility that the MUF may reach 50 MHz over some paths, particularly over lower-latitudes. This may permit some limited opportunities for DX on 6 meters. Presently, however, it appears as though MUF's will remain confined to frequencies mostly below 45 MHz.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 07 JANUARY

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6427	S09W87	187	0390	CAO	06	005	BETA
6429	S24W76	176	0030	BXO	04	004	BETA

NOTES:
The data above represents planetary geomagnetic activity. Data from many magnetic observatories around the world are used in constructing the above chart. The first graph line for each day represents geomagnetic activity which occurred between 00 UT and 03 UT. The second graph line represents activity which occurred between 03 UT and 06 UT, etc. For information regarding the interpretation and/or use of these charts, send a request for the document "Understanding Solar Terrestrial Reports" to: std_oler@hg.uleth.ca.

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

               Cumulative 60 day Solar Activity Record
                   Start Date:  November 9, 1990
```

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

|  VHF DX  | Given in 8 hour local time intervals  |    |AURORAL BACKSCATTER|
|__________|_______________________________________|    |___________________|
```

NOTES:

These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "std_oler@hg.uleth.ca".

I don't see how you could enforce a ban on commercial equipment, since one
could regard a commercial rig as a homebrewed rig with a single part (the
radio itself). Homebrew allows ANYTHING! However, I do think some spectrum
space reserved for hams who have passed an EXTREMELY rigorous technical exam
(one involving heavy duty questions about circuit theory, construction
techniques, and so forth) would be great. This license class should require

only the 5 wpm minimum code, and ANY emmission should be allowed there. In other words, anyone who has the technical punch to homebrew should get to strut his stuff in the "Homebrewer's band'.

I've seen many articles here over the past 6 months on the R5, including this week's comments. Off the list, though, I hear a lot of people say, "Get a Butternut vertical and you'll have 80 and 40 as well." Can anyone offer a comparison of the Cushcraft and Butternut verticals?

>Can anyone suggest keyer paddles, advantages of each vendor, etc.

The Bencher paddle is the acknowledged market leader. It's made by W9KNI in Chicago. Bob is an active CW user, is a member of the First-class CW Operators Club, and was involved in the design of the CMOS Superkeyer II which has recently been discussed in this newsgroup. My Bencher paddle is 10 years old now. I use it almost every day and it has needed no maintenance.

Keep the J38, they are becoming rare and increasingly valuable.

For all those interested in getting health and welfare traffic over to
U.S. Military deployed personel in the Gulf region - there is a BBS running
out of the American Embassy in Riyhad - 7Z1AB.
Traffic can get to 7Z1AB from Stateside via Packet or the Internet.
Specify in the message who the traffic is destined for - including rank
and other specifics if available. A network of fax machines are set up to get
the message to it's destination ASAP once it arrives at 7Z1AB.
Here are the addresses for heath and welfare traffic ONLY - (please use this
for personal messages only - no bullitens or "To all troops in the gulf:")

Packet:
7Z1AB @W3IWI.MD.USA

Internet:
Clark@tomcat.gsfc.nasa.gov

>Hey! Where can you get this stuff...?

Your local electronics supply house should have "Electronic Grade" RTV
which is non-acidic.  General Electric's RTV-162 is what I use.

>process requires one to pass some element at the exam session for a 610 to
>be generated.
>
>Jerry Simonowits

I sent email to W5YI, Fred Maia, and got his reaction to this. He disagrees with your VE.

Fred states that anyone who comes to a VE session on or after 2/14/91 with a *valid* CSEC for elements 2 (Novice written) and 3A (Tech written) will have a form 610 completed by the VEs and sent to the FCC requesting a codeless Tech license. CSECs are valid for 365 days, so one could walk in on 2/14/91 with a CSEC dated 2/15/90.

Your NJ VE is just making more work for himself in February.

So avoid the rush. Test now!

How about special lanes on the interstates for people who build their own cars?

Maybe we'll all stop giving thumbs-down to RS when they market a 2-meter
transceiver for 99.95, after the huge market demand that will be created
by the enormous influx of new Hams.

Won't that be fun?

Issuing the command "uupath arrlhq" on my system returns the bang path to
arrlhq. The only well-connected machine I recognize in the path is
rutgers. Using your own route to rutgers you would add:

!rutgers!njin!uupsi!mstr!uhasun!arrlhq!(recipient)

CB'er in (non-RS) radio store: "This coax I bought here is supposed
to be 50 ohms but I tested it with my ohmmeter and it's an open
circuit. Take it back and gimme some good cable!"

I made a clerk in the local RS very happy by showing him how to use an
ohmmeter to test a complaining customer's stereo patch-cable which
turned out to be broken internally.

If you have a PostScript output device available, a scanned .EPS version
of the manual is available for FTP from wilbur.Stanford.EDU

The file name is R1.tar.Z and it's in the pub/ durectory. It uncompresses
to just under 5 MB of scanned pages.

My initial enthusiasm for the R1 has been tempered greatly by its performance
limitations, especially the poor image rejection that's been pointed out here
before. This makes using it in a busy metropolitan area a frustrating
experience.

I think what you want is a ground plane antenna (one vertical element,
and the other element consisting of 4 or more horizontal or slightly
drooping radials). Then just use two or more vertical elements connected
in parallel. At any given frequency, the impedance of the one that is
resonant will be *much* lower than that of the others in parallel with it.

  The radials should be at least as long as the longest vertical element.

  Note also that any antenna of this type will also resonate at 3 and
  5 times the frequency it is cut for. This combined with the generally
  non-critical nature of receiving antennas, might let you get by with
  one vertical element.

The rather lengthy comments about homebrewing are all too
true.
It's bad enough that no one even thinks about building his
own transmitter these days
They all buy MFJ tuners instead of homebrewing something
infinitely better for a fraction of the cost

Is the ultimate limit "BUYING A DIPOLE"?

A technical discussion overheard on two meters centered about
a simple circuit in which a tubular object about an inch long
and .25 dia. with a wire on each end had obviously become
overheated, charred, and presented a highly unserviceable
appearance.
Long discussion about what a resistor was doing in that circuit

--How do I find out how a resistor ;is good or bad?

-- Check ;it with an ohmmeter.

--- "What's an ohmmeter?"

Mounting an R5 near a triband beam is probably not a good idea. You will have coupling between the two antennas, and the directivity of the yagi wil be ruined by the current induced in the omnidirectional vertical. Try to separate the two antennas by more than a half wavelength (at 14 MHz).

'Comet' antennas - well, I bought a HS-WX1 (dualband 144/430 colinear) and whilst the mechanical construction was sort-of OK, the electrical construction seemed flakey to me.
The antenna is fed by attaching the inner of the coax to the centre junction of two capacitors fitted across a coil - these 2 capacitors were

disc-ceramic and rated at only 100 volts, and were encapsulated in the cheap 'biscuit' type resin which is not moisture-proof; i re-engineered the feed using 1Kv silver-mica capacitors of higher quality, and slathered the whole feedpoint in non-acidic RTV rubber to keep out what passes for weather round here.
The actual radiating element was made out of copper plated steel wire (same thickness as the cheap metal garment-hangers you get from dry cleaners!) stuffed up inside a fibre-glass tube (so it rattled!).

Overall, I disliked the electrical construction - not a patch on my old (British) Jaybeam C5 colinear; (but then the Jaybeam only works on 2 meters and costs 3 times as much) I guess you get what you pay for.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF OHIO

EASTERN DIVISION

JAMES D. MacMILLAN, Plaintiff, - vs - CITY OF ROCKY RIVER, et al., Defendants.	)	1:87,CV 2820 ORDER

Battisti, J.

Before the court is Defendants' Motion to Dismiss and/or for Summary Judgment. Also before the court is Plaintiff's Motion for Partial Summary Judgment on Counts I and III of his Complaint.

Plaintiff James D. MacMillan ("MacMillan"), an amateur radio operator, licensed by the Federal Communication Commission, brings this action against the City of Rocky River, the Building Commissioner for the City of Rocky River ("Commissioner"), in his individual and official capacities, and the members of the Board or Zoning and Building Appeals of the City of Rocky River ("Board"), individually and in their official capacities, for denying, pursuant to certain City ordinances, his application to construct a thirty foot radio antenna system at his Rocky River residence. MacMillan seeks a declaratory judgment, injunctive relief and damages, based upon alleged violations of his rights under the United States Constitution and relevant federal statutory law (1)

Jurisdiction in the federal district court is predicated upon these alleged violations of the United States Constitution and federal statutory law. 28 U.S.C. (sect.)(sect.) 1331, 1337 and 1343 (1982).

I. FACTS
